

1. Introduction

1.1. The Project

The DAHN project is a project between the University of the Mans, the EHESS and INRIA, and with the partnership of the Ministry of Higher Education, Research and Innovation. Its goal is to create a program for digital scientific edition of corpus of letter exchanges, with, as a basis, the correspondence of Paul d'Estournelles de Constant, senator of Sarthe and 1909 Nobel Peace Prize. The work is to be made in two steps : first, refreshing an already existing numeric environment to let in that new edition. Then, adding the correspondence of d'Estournelles, while documenting the methodology and the actions made. The first editorial platform (from Lettres et Textes) was first developed between 2010 and 2016 and enabled the creation of a data model that combines genetic edition and named entities network. Though on a precise subject, it was thought to be a generic tool that allows transverse research on egodocuments and printed corpus, from every modern or contemporary period and in all imaginable European situations on those periods.

1.2. About this document

This document describes the encoding guidelines and decisions that were made specifically for our project and our editions. It is not a replacement for the original TEI documentation. Rather, it focuses on the way we use TEI elements in order to fit every phenomenon we need to encode. For this reason, only elements that we actually use are described together with exact details on how we use them.

2. Document Encoding

This TEI encoding must be adapted to the document format we are going to use on the platform created for the project: ego document. Ego documents are written personal documents such as diaries, memoirs or wills. They usually are dated and signed, which will required some recurrent elements on the encoding.

For each manuscript, a single XML document is created. This part describes elements appearing in those documents including header and body.

2.1. The header

2.1.1. *<teiHeader>*

As usual, the header comprises the *<teiHeader>* element. Following the TEI guidelines, the *<fileDesc>* (the main characteristics of the document), *<encodingDesc>* (editorial rules), *<profileDesc>* (information about the content) and *<revisionDesc>* (the history of the encoding) elements are used in *<teiHeader>*. Inside the header, descriptions are given in French or English, and German where appropriate.

2.1.1.1. *Creating the <fileDesc>*

Within *<fileDesc>*, there are the following elements:

- **titleStmt** (title statement) groups information about the title of a work and those responsible for its content.
- **publicationStmt** (publication statement) groups information concerning the publication or distribution of an electronic or other text.
- **seriesStmt** (series statement) groups information about the series, if any, to which a publication belongs.
- **sourceDesc** (source description) describes the source from which an electronic text was derived or generated, typically a bibliographic description in the case of a digitized text, or a phrase such as "born digital" for a text which has no previous existence.

2.1.1.1.1. *<titleStmt>*

In the mandatory element *<titleStmt>*, we always encode the title of the document (*<title>*), authors and editors (not for letters), and information on its digital version: the funder (*<funder>*), the head of the project (*<principal>*), and, inside as many *<respStmt>* elements as needed, all other staff members and contributors who have worked on the digital version of the particular document. In case of letters, the *<title>* is structured as follows: "Letter from + name of the sender + to + name of the addressee + (place, date)". For example:

```
<title xml:lang="en">Letter from Ludwig Tieck to Friedrich von Raumer (Ziebingen, 30 March 1815)</title>
```

In some case, the letter can be numbered by the sender. It is possible to add that number onto the title, which then would be structured as follows : "Letter number + number of the letter + from + [...]".

In case of other manuscripts, the *<title>* element contains the title as written on the manuscript or given in another form.

For letters, we do not use the *<author>* element. Instead, the sender and the addressee are encoded in *<correspDesc>* inside *<profileDesc>*.

For other types of texts, `<author>` and `<editor>` may be used. We have decided to use `<editor>` only for roles belonging to the original text, i. e. roles that have led to the original text as it is. The role is specified in the `role` attribute of `<editor>`. For roles of digital edition project members, we use `<respStmt>` (see below).

If there is more than one author or more than one person with the same role, then their names are grouped inside one `<author>` or `<editor>` element, respectively. These are examples of our intended use of the `<author>` and `<editor>` elements:

```
<author>
  <persName ref="#p0001">Ludwig Tieck</persName>
</author>
<editor role="annotator">
  <persName ref="#p0002">Wilhelm Heinrich Wackenroder</persName>
  <persName ref="#p0003">Another annotator</persName>
</editor>
<editor role="literary_executor">
  <persName ref="#p0004">Rudolf Köpke</persName>
</editor>
```

The `<funder>` element must contains the name of the person or organism that finance the project.

The `<principal>` element must contains the name of the person responsible for the creation of the encoding. It contains detailed elements (forename, surname, and the complete address of the affiliation).

The next item `<respStmt>` comprises the declaration of all persons who took part in the research and edition of the encoded document. We have selected five different responsibilities: “edited by”, “prepared by”, “in collaboration with”, “with help from” and “digitization by”.

2.1.1.2. `<publicationStmt>`

The `<publicationStmt>` element typically contains all information about the publisher, the publication place and date and the restrictions of its use. At least, three tags are required to encode the document: `<authority>` (organization or person responsible for the publication of the project), `<availability>` (licence for the project) and `<date>` (publication of the project).

2.1.1.3. `<seriesStmt>`

The `<seriesStmt>` element groups information about the series or collection to which the document belongs. For our two example cases, it would coincide with the name of the projects the documents are link to, either “Letters and texts from intellectual Berlin around 1800” or “Correspondence of Paul d’Estournelles de Constant”. We also specify genre and topic of each document. To do so, we use `type` attributes with the values main for the name of the edition, genre for genre and topic for topic. Genre and topic may appear more than once. For example:

```
<seriesStmt>
  <title type="main">Letters and texts from intellectual Berlin around 1800</title>
  <title type="genre">Letters</title>
  <title type="genre">Logs/reports</title>
  <title type="topic">Berlin University</title>
</seriesStmt>
```

2.1.1.4. `<sourceDesc>`

The following element, `<sourceDesc>`, is used for all metadata describing the sources of the digital edition. This element is repeatable, so one could describe different sources if one TEI document for the digital edition is based on several manuscripts. The documents we are encoding are personal documents, letters or others, handwritten or typescript depending on the period. For this reason, the `<sourceDesc>` element always contains the sub-element `<msDesc>`, which is intended for the description of manuscripts. If the manuscript is a letter, it also contains `<correspDesc>` to identify the sender and addressee.

2.1.1.4.1. `<msDesc>`

The `<msDesc>` element contains the following elements. The first four are mandatory, `<additional>` is optional.

- **msIdentifier** (manuscript identifier) contains the information required to identify the manuscript or similar object being described.
- **msContents** (manuscript contents) describes the intellectual content of a manuscript, manuscript part, or other object either as a series of paragraphs or as a series of structured manuscript items.
- **physDesc** (physical description) contains a full physical description of a manuscript, manuscript part, or other object optionally subdivided using more specialized elements from the `model.physDescPart` class.
- **history** groups elements describing the full history of a manuscript, manuscript part, or other object.
- **additional** groups additional information, combining bibliographic information about a manuscript or other object, or surrogate copies of it, with curatorial or administrative information.

2.1.1.4.1.1. `<msIdentifier>`

In the `<msIdentifier>` element, all information concerning the institution, the manuscript’s collection and its identifier (`<idno>`) is placed. A `type` attribute for `<idno>` can be used to be more specific about who gave this identifier. It is necessary to differentiate between the `<repository>` and the `<institution>` element. Institution represents the conservation place, while repository represents the department in it where the document is preserved. The expected content for this part has also been modified (in the `<schemaSpec>` below) in order to be more accurate with the physical address of the manuscript’s institution. For example:

```
<msIdentifier>
```

```

<location>
  <address>
    <street>9 rue Christian Pineau</street>
    <postCode>72100</postCode>
    <settlement>Le Mans</settlement>
    <region>Pays de la Loire</region>
    <country key="FR">France</country>
  </address>
</location>
<institution ref="#ADSarthe">Archives départementales de la Sarthe</institution>
<repository>Fonds des archives privées</repository>
<collection>Fonds d'Estournelles de Constant</collection>
<idno>12 J</idno>
</msIdentifier>

```

2.1.1.4.1.2. <msContents>

The only sub-element of <msContents> is <msItem>. We use it for three different purposes.

First, the document date may be given inside <docDate>. This is the date originally written on the letter or manuscript by the author [*Note: If a date was written by a different person, for example by an archivist, it is not included in <docDate>/*. It may be identified as incorrect and thus differ from the <origDate> (origin date) in the <history> section, where the actual date (which can be a supposition) is declared. If no date is given on the manuscript, then <docDate> is left out and only <origDate> appears in the header. If <docDate> and <origDate> are the same, then both still appear.

Second, <msItem> may be used to give a summary of the manuscript or other details written by a project member in one or more <note> elements with the *resp* attribute. For one of our project, we use it to declare an annex, if one is present in the document.

Third, <msItem> may be used to give keywords for the manuscript. They are also included inside <note> elements—one for each keyword—with *resp* and *type=keyword*.

Here is an example including all three cases :

```

<msContents>
  <msItem>
    <docDate when="1919-02-04" />
    <note resp="#floriane.chiffoleau">This letter is joined with an annex.</note>
    <note type="keyword">
      resp="#floriane.chiffoleau">President Wilson</note>
    </msItem>
</msContents>

```

2.1.1.4.1.3. <physDesc>

<physDesc> comprises the physical description of the manuscript. In our case, <physDesc> may contain three to six elements:

- **objectDesc** contains a description of the physical components making up the object which is being described.
- **handDesc** (description of hands) contains a description of all the different hands used in a manuscript or other object.
- **accMat** (accompanying material) contains details of any significant additional material which may be closely associated with the manuscript or object being described, such as non-contemporaneous documents or fragments bound in with it at some earlier historical period.
- **additions** contains a description of any significant additions found within a manuscript or other object, such as marginalia or other annotations.
- **sealDesc** (seal description) describes the seals or similar items related to the object described, either as a series of paragraphs or as a series of <seal> elements.
- **decoDesc** (decoration description) contains a description of the decoration of a manuscript or other object, either as in paragraphs, or as one or more <decoNote> elements.

In the <objectDesc> element, the material, the dimensions, the state of conservation etc. of the manuscript are specified and are grouped inside <supportDesc>. Those information are available in different languages: English is required to help with the comprehension of the metadata and others, to match with the language of the corpus or not. In each tag, the tag used to specified the language can be the parent tag or a <p>, according to the rules of the TEI Guidelines, joined with an attribute *xml:lang*.

```

<objectDesc>
  <supportDesc>
    <support>
      <material>
        <material xml:lang="de">Geripptes Papier mit Wasserzeichen.</material>
        <material xml:lang="en">Laid paper with water mark.</material>
        <material xml:lang="fr">Papier finement côtelé comportant un filigrane.</material>
      </material>
    </support>
    <extent>
      <measure type="folio">
        <measure xml:lang="de">1 Bogen, 2 Blatt</measure>
        <measure xml:lang="en">1 sheet of paper, 2 folios</measure>
        <measure xml:lang="fr">2 feuillets</measure>
      </measure>
    <dimensions unit="cm">

```

```

<height>...</height>
<width>...</width>
</dimensions>
</extent>
<foliation corresp="#pencil">
<p xml:lang="de">Foliiierung eines Archivars mit Bleistift.</p>
<p xml:lang="en">Foliation by the archive, in pencil.</p>
<p xml:lang="fr">Numérotation des pages par les archives, crayon de papier.</p>
</foliation>
<foliation corresp="#blue_pen">
<p xml:lang="de">Foliiierung eines Archivars mit blauem Stift.</p>
<p xml:lang="en">Foliation with blue pen by the archive.</p>
<p xml:lang="fr">Numérotation des pages par les archives, au crayon bleu.</p>
</foliation>
<condition>
<p xml:lang="de">Guter Erhaltungszustand, Faltspuren, Spuren der Aktenbindung. Auf dem zweiten
Blatt Loch im Papier durch Siegelausriss, Ausschnitt.</p>
<p xml:lang="en">In a good state of preservation, traces of folding and binding. On second
folio hole due to tear by seal, cutting.</p>
<p xml:lang="fr">En bon état. Quelques traces de plis. Déchirure au niveau du sceau.</p>
</condition>
</supportDesc> ...
</objectDesc>
```

`<foliation>` contains descriptions of foliations. The `corresp` attribute links each foliation with the hand who made it (as described by a `<handNote>`) or—only if it is made by us—with the corresponding person in the index of project members.

In a letter or some personal document, you may find letterhead or pre-printed element on the support. The choice was made to describe those element on the `<layoutDesc>`, inside a `<layout>` tag with an attribute and then in `<p>` tag with attribute for the language. It will then be presented and linked in the `<body>`, inside a `<fw>` element, as it was proposed on one of the article from Encoding Correspondence.

```

<objectDesc> ... <layoutDesc>
<layout xml:id="lh-senat">
<p xml:lang="fr">Un en-tête, où est écrit "Sénat" en majuscule et souligné, est imprimé en
haut à gauche de la première feuille de la lettre.</p>
<p xml:lang="en">A letterhead, where an underlined uppercased "Sénat" is written, is printed
on the top left of the first folio of the letter.</p>
</layout>
</layoutDesc>
</objectDesc>
```

The `<handDesc>` element is also part of `<physDesc>`. Here, the different hands found in the manuscript can be identified and described with as many `<handNote>` elements as needed. More than one `<handNote>` element can belong to the same person: if an author completed a text after a long time, two different hands could be identified for him.

`<handNote>` is also used to describe which scripture the hand uses predominantly. The following attributes are used :

- `xml:id`: An identifier of the hand.
- `scope`: The hand's preponderance in this manuscript.
- `medium`: Which instrument has the hand been using?
- `scribeRef`: Points to the person responsible for the hand, i.e. to the respective `<person>` element in the index of persons. This attribute is always given, even if the person is the author/sender. If the hand is of an archivist that cannot be identified as a person, then this attribute points to the corresponding archive in the index of organizations.
- `scribe`: The function that the person has in this particular text.
- `corresp`: Only used with `scribe="publisher"` (see list below).

. Similar to what we already explain for the preceding tags, each hand must be described inside a `<p>` tag and with a language attribute.

In the TEI header:

```

<handDesc>
<handNote medium="black_ink" scope="major"
scribe="author" scribeRef="#p0133" xml:id="major_hand">
<p xml:lang="de">Hand des Absenders Ludwig Tieck, Brieftext in schwarzer Tinte, vorwiegend in
Kurrentschrift.</p>
<p xml:lang="fr">Main de l'expéditeur Ludwig Tieck, corps de la lettre, encre noire, écriture
majoritairement gothique.</p>
<p xml:lang="en">Hand of sender Ludwig Tieck, letter text in black ink, mainly German
script.</p>
</handNote>
<handNote medium="red_ink" scope="minor"
scribe="addressee" scribeRef="#p0187" xml:id="red_hand">
<p xml:lang="de">Wahrscheinlich Hand von Friedrich von Raumer zur Zeit der Vorbereitung für
den Druck, Beschriftung des Briefs auf der ersten Seite in rot.</p>
<p xml:lang="fr">Probablement la main de Friedrich von Raumer lors de sa préparation du
manuscrit pour la publication, quelques annotations à l'encre rouge.</p>
<p xml:lang="en">Very likely Hand of Friedrich von Raumer at the time when he prepared his
edition of this letter; few remarks and deletions in red ink.</p>
</handNote>
<handNote medium="pencil" scope="minor"
```

```

    scribe="archivist" xml:id="pencil">

Hand eines Archivars; Folierung in Bleistift.

Main de l'archiviste qui a numéroté les pages; crayon de papier.

Hand of an archivist in charge of foliation, in pencil.

```

Corresponding *hand* in the body:

```
<note hand="#red_hand" place="inline">Tieck an Raumer</note>
```

There may only be one hand with *scope*=”major”. This is defined to be the default hand of the document, i. e. the hand that is active in parts of the body where no *hand* attribute is given. All other hands have *scope*=”minor”. When there is only one hand in the whole manuscript, *scope*=”sole” is used instead of *scope*=”major”. Then this hand is the default hand, of course. The following values can be used for *scribe*:

- author: The hand is of the author/sender.
- publisher: The hand is of somebody who played a role in publishing the text. In this case, the attribute *corresp* can be used to point to the entry of the corresponding publication in the index of works (see example above).
- commentator: The hand is of a commentator.
- archivist: The hand is of an archivist (no matter if the archivist person is known by name or not—see the description of *scribeRef* above).
- copyist: The hand is of a copyist, i.e. a person who copied a manuscript authored by somebody else.
- addressee: In case of letters, the hand is of the addressee (i. e. the person given in <correspAction type=”received”>inside <correspDesc>.
- unknown: The person and role of the hand are unknown.
- other: The hand is of a person whose role does not fit in the other categories but who is not unknown.

Furthermore, <physDesc> may contain <sealDesc> where seals used to close the letter (wax etc.) are specified.

It can also contain a <additions> element, used to describe any additions made inside the manuscript and on its pages.

```

<additions>

L'institution qui conserve ce fond a apposé sur toutes les feuilles de textes,  
généralement dans la marge, un tampon où il est inscrit : <stamp resp="#stamp">Archives de la  
Sarthe <lb/>Propriété publique</stamp>.</p>

The institution that held the collection applied on each folio, usually in the  
margin, a stamp where it is written: <stamp resp="#stamp">Archives de la Sarthe <lb/>Propriété  
publique</stamp>.</p>
</additions>

```

Any material accompanying the letter—for example an envelope, a picture, a drawing etc.—is described inside <physDesc> using the <accMat> element. Envelopes are usually regarded as part of the manuscript pages and are transcribed like normal pages but are being pointed to from <accMat>.

```

<accMat>
<p xml:lang="fr">La lettre est accompagnée d'une annexe de six pages.</p>
<p xml:lang="en">The letter also contains a six pages annex.</p>
</accMat>

```

2.1.1.4.1.4. <history>

After the <physDesc> element, we can now take a look at the <history> element inside <msDesc>. The full history of a manuscript is described here:

from its creation until today (going through the place and date of creation, the provenance, the acquisition...). Two child elements can be used: <origin> and <acquisition>.

<origin> describes at least the place of creation of the manuscript (inside <origPlace>) and its date of creation (inside <origDate>). Further information may be added.

The actual date of creation may differ from any date written on the manuscript, <origDate> contains a date that is either identified as correct or is a supposition, <docDate> appearing inside <msItem> contains a date written on the manuscript even if that is incorrect. If <origDate> and <docDate> are the same, both still appear. For example:

```

<history>
<origin>

Der Brief wurde in <origPlace ref="#10066">Ziebingen</origPlace> am  
<origDate when-iso="1815-03-30">30. März 1815</origDate> verfasst.</p>

la lettre a été composée à <origPlace ref="#10066">Ziebingen</origPlace> le  
<origDate when-iso="1815-03-30">30 mars 1815</origDate>.</p>

The letter was composed in <origPlace ref="#10066">Ziebingen</origPlace> on  
<origDate when-iso="1815-03-30">30th March 1815</origDate>.</p>
</origin> ...
</history>

```

<acquisition> records how the manuscript entered the institution that is currently holding it:

```

<acquisition>
<p xml:lang="de">Der Nachlass 239 (<persName ref="#p0248">L. de La Foye</persName>) wurde im <date when-iso="1990-05">Mai 1990</date> als Teil  
Innern von der Galerie Gerda Bassenge (Berlin, Auktion 55, Teil 1, <date when-iso="1990-05-02/04">2.-4.5.1990</date>, Nr. 3009) erworben. Er  
Bundesrepublik Deutschland und als Dauerleihgabe der Staatsbibliothek zu Berlin übergeben  
worden.</p>
<p xml:lang="en">The <persName ref="#p0248">de La Foye</persName> papers (NL 239) were acquired by  
the State Library in <date when-iso="1990-05">May 1990</date> (auction 55 of the Galerie Gerda  
Bassenge, Berlin, part 1, <date when-iso="1990-05-02/04">2.-4.5.1990</date>, Nr. 3009). They  
were funded by the German Ministry of Inner Affairs and loaned to the State Library.</p>

```

```
<p xml:lang="fr">Les papiers <persName ref="#p0248">de La Foye</persName> (NL 239) ont été acquis par le ministère allemand de l'intérieur lors de la vente aux enchères organisée par la Galerie Gerda Bassenge en <date when-iso="1990-05">mai 1990</date> (Berlin, enchère 55, partie 1, <date when-iso="1990-05-02/04">2.-4.5.1990</date>, No. 3009). Ils sont la propriété de l'État allemand, qui les a confiés sous la forme d'une prêt durable à la Librairie d'État de Berlin.</p>
</acquisition>
```

2.1.1.4.1.5. <additional>

The optional element `<additional>` is the last sub-element of `<msDesc>` and is currently only used to hold a `<listBibl>` describing publications that are in some way related to the manuscript. These are usually earlier prints of the manuscript but could also be other works where text portions appearing in the manuscript were published. Each publication is given in a `<bibl>` element and then `<bibl>` sub-elements with `xml:lang` attribute (the paragraph tag `<p>` is not allowed). The tag contains a short bibliographic description, usually using `<title>` and `<persName>` elements. Full descriptions are given in the index of works and are being pointed to using `ref` of `<title>`.

```
<additional>
<listBibl>
<bibl>
<bibl xml:lang="de">
<persName ref="#p0261">Riegel</persName> (1934): <title ref="#w00253">Correspondance d'Adelbert de Chamisso, Fragments inédits</title>, Brief 42.</bibl>
<bibl xml:lang="en">
<persName ref="#p0261">Riegel</persName> (1934): <title ref="#w00253">Correspondance d'Adelbert de Chamisso, Fragments inédits</title>, Lettre 42.</bibl>
<bibl xml:lang="fr">
<persName ref="#p0261">Riegel</persName> (1934): <title ref="#w00253">Correspondance d'Adelbert de Chamisso, Fragments inédits</title>, 42.</bibl>
</bibl> ...
</listBibl>
</additional>
```

2.1.1.2. Creating the <encodingDesc>

After `<fileDesc>`, the second top-level portion of the header is `<encodingDesc>`. It comprises `<projectDesc>` (which simply names the respective project) and `<editorialDecl>`.

The `<editorialDecl>` element is used for documenting decisions concerning corrections (`<correction>`) and hyphenation (`<hyphenation>`) in the manuscript.

```
<encodingDesc>
<projectDesc>
<p xml:lang="fr">L'encodage de ce document s'est fait dans le cadre du projet DAHN d'"Éditions numériques de manuscrits historiques (correspondances)".</p>
<p xml:lang="en">The encoding of this document is part of the DAHN Project "Digital Editions of historical manuscripts (correspondences)".</p>
</projectDesc>
<editorialDecl>
<correction>
<p xml:lang="fr">Aucune correction</p>
<p xml:lang="en">No correction</p>
</correction>
<hyphenation eol="all" rend="sh">
<p xml:lang="fr">Toutes les coupures de mots pour fin de ligne (indiquées principalement avec un tiret simple) ont été conservées.</p>
<p xml:lang="en">All the end-of-line hyphenation (made with a single hyphen) have been kept.</p>
</hyphenation>
</editorialDecl>
</encodingDesc>
```

We usually do not do any normalization and we can do some corrections that is explained in `<correction>` and are demonstrate later, in the `<body>` part.

The attribute for `<hyphenation>` differs according to the kind of texts that we have, because its presence and format depends on the author. When present, it always has the attribute `eol="all"` which—as specified in the TEI guidelines—describes the way we deal with end-of-line hyphenation (see also the description of `<lb>`). Furthermore, it needs the attribute `rend` where we state which is the default hyphenation character in the manuscript, i.e. the one which appears most often (here, the "sh" means a single hyphen ("‐")). It uses the same values as the `type` attribute of `<lb>`. The `type` attribute of `<lb>` is only mandatory if the hyphenation character in the specific case differs.

2.1.1.3. Creating the <profileDesc>

2.1.1.3.1. <correspDesc>

`<profileDesc>` is used for two purposes. For letters, it contains `<correspDesc>`. Here, the sender and addressee are identified using the sub-element `<correspAction>` and a corresponding attribute: `type="sent"` for the sender and `type="received"` for the addressee. If applicable, previous and following letters are referenced by their file names in our edition using `<correspContext>`. For example:

```
<correspDesc>
<correspAction type="sent">
<persName ref="https://viaf.org/viaf/34463780/">Ludwig Tieck</persName>
<placeName ref="https://www.geonames.org/3101255">Ziebingen</placeName>
<date when-iso="1815-03-30"/>
</correspAction>
<correspAction type="received">
<persName ref="https://viaf.org/viaf/64809232/">Friedrich von Raumer</persName>
</correspAction>
<correspContext>
<ref target="Brief02TieckRaumer.xml"
  type="next"/>
</correspContext>
</correspDesc>
```

For the sending side, the originating place is also given, as is the date. For the receiving side, this is usually not the case. However, if the information is given, it should be included. Currently, the place and date are doubled in `<msItem>`, `<history>` and `<dateline>`, respectively.

In this part of the encoding, instead of using the references encoded in their corresponding index, we put identifier from authority file like Geonames and VIAF, to be compatible with the standard of the Correspondence Metadata Interchange Format (CMIF) and then be findable via correspSearch.

2.1.1.3.2. `<langUsage>`

Inside `<profileDesc>`, we also specify the languages of the manuscript in `<langUsage>` :

```
<langUsage>
  <language ident="de" usage="80"/>
  <language ident="fr" usage="20"/>
</langUsage>
```

Each langage is identified in a `<language>` element. The approximate percentage of language usage is given in the attribute *usage*. When there is only one language, usage becomes 100, of course. In those cases, *usage* may be left out.

2.1.1.4. Creating the `<revisionDesc>`

`<revisionDesc>` is the last direct child element of `<teiHeader>`. It summarizes the revision history of the file which is given in English only. Each revision is recorded in a `<change>` element with a *who* attribute which refers to the *xml:id* attribute of the corresponding `<person>` entry within the index of contributors.

```
<revisionDesc>
  <change when-iso="2012-06-04"
    who="#anne.baillot">Updated the transcription and added all the elements in
    English and French (in the header and in the notes in the body).</change>
  <change when-iso="2012-04-02"
    who="#anne.baillot">Updated a few details.</change>
  <change when-iso="2012-03-26"
    who="#anne.baillot">Finished encoding, revised header, added comparison with
    print version.</change>
  <change when-iso="2012-03-16"
    who="#anne.baillot">First encoding (up to line 208). Have to check published
    letters before proceeding with the transcription; the text sounds familiar.</change>
</revisionDesc>
```

The `<revisionDesc>` will also be used, in our documents, to indicate the level of finalization of the encoding files published on the platform of our project. We have three level of encoding :

- raw transcription
- annotation in progress
- finalized document

Those different steps will be indicated with an attribute *status* with a value for each of those steps :

- raw_transcription: the document is simply transcribed
- annotation_in_progress: the transcription is done and the annotation are in progress
- final_publication: the document is fully finalized and ready for publication

2.2. The body

After `<teiHeader>`, the element `<text>` follows. It always contains the `<body>` of the text. It can sometimes also contains `<front>` and `<back>` but it's less relevant for the egodocuments. Of `<body>`, the only direct sub-element is a `<div>`: `<div type="transcription">`. Inside of it, the actual body, i. e. the text of the manuscript appears.

2.2.1. Structuring the transcription

2.2.1.1. Paragraphs: `<p>`

Paragraphs are included inside `<p>`. A paragraph is defining as beginning and ending with line breaks. Sometimes, however, the end of a paragraph is not marked by a line break but by leaving an amount of space after the last sentence and having the new paragraph begin on the same line. In these cases, *rend="nolb"* is used for the `<p>` before that space. This indicates that there is no line break after it:

```
<p rend="nolb">This paragraph ends without a line break but only with a space.</p>
<p rend="nolb">This one, too.</p>
<p>This paragraph, however, ends with a line break.</p>
```

2.2.1.2. Line breaks: `<lb>`

All line breaks are tagged with the `<lb>` element. The way we encode end-of-line `<lb>` hyphenation is described in the `<hyphenation>` element in the header. When a word is being split at a line break, we keep the hyphenation character. The text

```
au développe- ment de la civilisation, est assimilé
```

thus becomes:

```
au développe-<lb break="no"/>ment de la civilisation, est
assimilé
```

As you can see, we use the attribute *break="no"* to denote that there is no new word starting there. In the XML file, there must be no spaces and no line breaks between the `<lb>` tag and the surrounding letters!

However, we retain the information about which hyphenation character is used. For each document, we specify a default end-of-line hyphenation character in the `<hyphenation>` element, that is the character which is used most often. If the hyphenation character in a specific case differs from the default one, we use the attribute `type` of `<lb>` to denote this. The following values are used for `type`:

- sh: single hyphen (“-”).
- dh: double hyphen (“=”).
- us: underscore (“_”)
- none: no hyphenation character at all in the original text.

Thus, if the default end-of-line hyphenation character is the single hyphen, but one location of the manuscript reads

```
Werd ich denn hier nun end= lich etwas finden?
```

then it becomes:

```
Werd ich denn hier nun end=<lb break="no" type="dh"/>lich etwas
finden?
```

In the rare case that the line after the break needs to be indented for whatever reason, values for `rend` have been defined. Use `<lb rend="indent">` for indentation as such without specifying how deep it is, or `rend="indent-1"`, `rend="indent-2"` and so on if you need more than one level of indentation: `indent-1` then means lowest, the highest number means highest level of indentation.

Another rare case is that a character appears after a line break that is not part of the text. See this example:

```
"Les dirigeants du monde ont pensé aux relations entre les "gouvernements ;
```

Here, a quotation mark appears at the beginning of each line (i. e. after each break), but it is not part of the text and thus must, for example, not appear in a display version. This is indicated by using a special value for `rend` with `<lb>`:

```
<lb rend="after:"/> Les dirigeants du monde ont
pensé aux relations entre les<lb rend="after:"/> gouvernements ;
```

The value “`after:”` means that the character “`”` appears after the line break. It is also possible to use `<lb rend="before:X">` for special characters that appear before the line break. Normally, line breaks are only shown in a display version of the transcription (the diplomatic version). In the unusual case where a line break that is marked with `<lb>` should also be shown in a reading version, `<lb rend="both">` may be used.

2.2.1.3. Page breaks and facsimilies: `<pb>`

The only element which refers to the picture is the page break element `<pb>`. Each `<pb>` has a `n` attribute which indicates the page number. For technical reasons it is required to always start with page number 1. The differing page number of an archivist etc. must be marked up as a note. The `facs` attribute is used to link to the picture on the server. The first child element of `<div type="transcription">` must be `<pb>`!

For example:

```
<body>
<div type="transcription">
  <pb n="1" facs="00000356.jpg"/>
  <opener/> ...
</div>
```

If a word is split at a page break, then the attributes `break="no"` and, if necessary, `type` are used in exactly the same way as in the `lb` element for line breaks (see above). Hyphenation characters are also dealt with in the same way as they are in line breaks. See this example:

```
Werd ich denn hier nun end=<pb n="2" facs="00000357.jpg" break="no"
type="dh"/>lich etwas finden?
```

Catchwords are included inside `<fw>` with the attribute `type="catch"` :

```
Werd ich denn hier nun <fw type="catch">end-</fw>
<pb n="2" facs="00000357.jpg"/> endlich etwas finden?
```

2.2.1.4. Logical text divisions: `<div>`, `<head>`, `<trailer>`

For logical text divisions (sections, subsections and so on), we used nested `<div>` elements. We do not use the numbered division elements `<div1>`, `<div2>` and so on. The first `<div>` of our document will always have an `type="transcription"`, but when appropriate, the subsequent `<div>` may have the attributes `type` specifying the type of division and `n` specifying the number of the division. Heading and trailing elements of the section as appearing in the manuscript are given inside `<head>` and `<trailer>`, respectively. These elements always belong only to the `<div>` of which they are direct sub-elements. For example, if a correspondence is giving a heading with “`Lettre n°` + number of the letter”, this can be encoded in a `<head>` element, as such :

```
<div type="transcription">
  <div type="letter">
    <pb facs=".JPG" n="1"/>
    <head rend="center underline">LETTRE N° 231.</head> ...
  </div>
```

Sometimes, an obvious logical unit of a manuscript can be identified but it has no heading given in the text. In these cases, we can (but do not need to) make up our own heading text. It can be included in `<head>`, but needs to be inside a `<note>` with `resp` :

```
<head>
```

```
<note type="structure"
      resp="#johanna.preusse">2. Akt</note>
</head>
```

2.2.1.5. Other text divisions: <metamark>

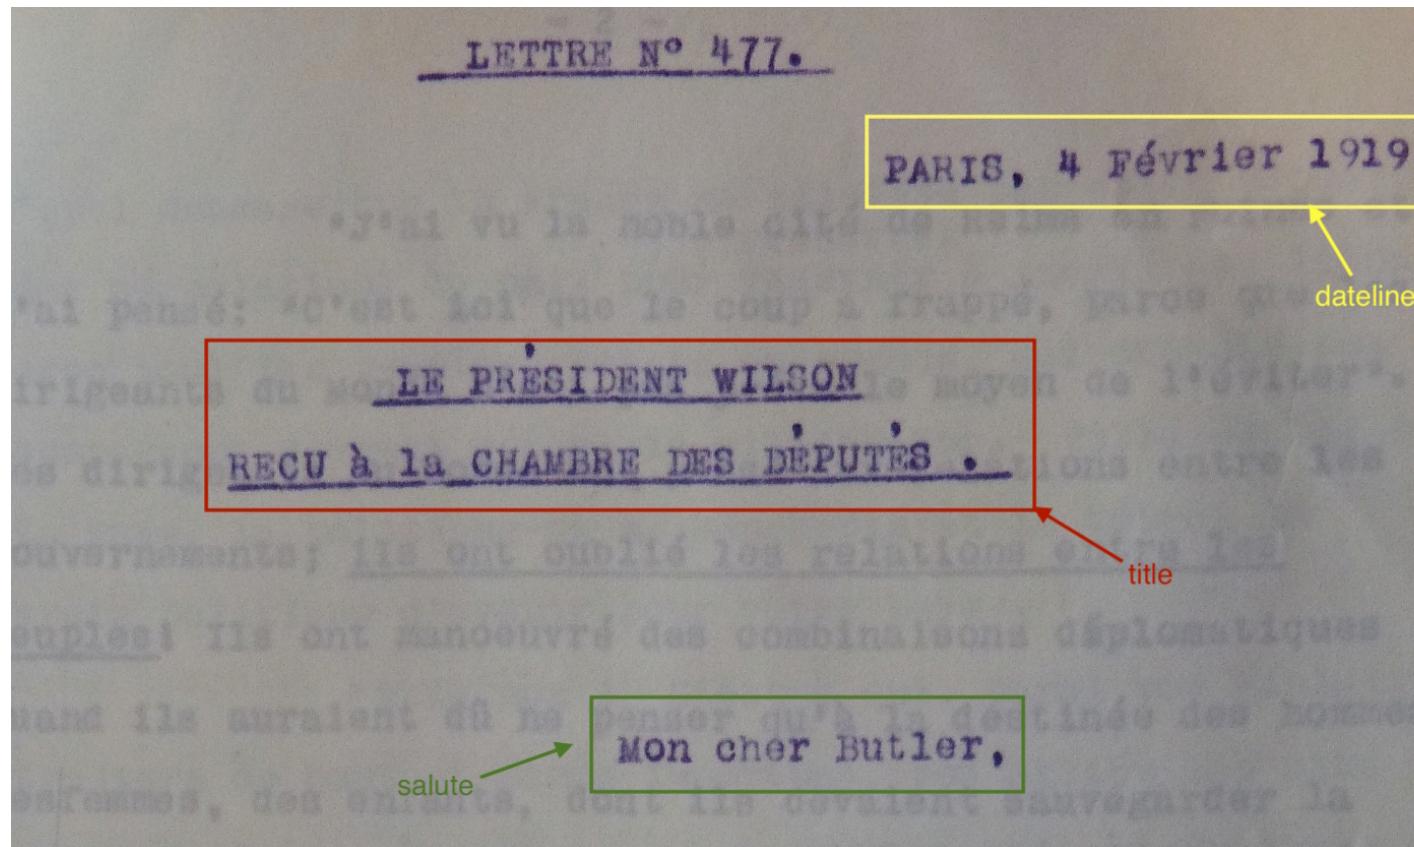

Sometimes, an author has obviously marked a division in the text that, however, does not belong to a logical unit such as section, subsection and so on, and thus cannot be marked using <div> elements. This division can have different aspects, such as simple lines between two portions of texts or little crosses. To mark this division, we use the element <metamark> with two attributes: *function* and *style* (occasionally, we also used the attribute *rend* to indicate the alignment of the division in the text). The value of *function* will always be separation, but the *style* will often change, according to the kind of sign used to mark this division. Here are few examples of values for *style*:

- crosses
- line
- double_line
- dots
- horizontal-rule
- curved-horizontal-rule
- vertical-rule
- X

2.2.2. Structuring the letter/egodocument

In every letter or egodocument with similar layout, we use specific elements to encode its opening and closing parts and some other recurring elements.

2.2.2.1. Opener: <opener>

According to the TEI guidelines, “<opener> groups together dateline, byline, salutation, and similar phrases appearing as a preliminary group at the start of a division, especially of a letter”. We use the <dateline> element to encode the place and the date of the letter, <salute> for the salutation. In some case, it is also possible to have a title for the letter, which can then be included inside the opener, as it is part of the opening of the letter. For example:

```
<opener>
<fw type="letterhead" place="align(left)"
     corresp="#entete-senat">
```

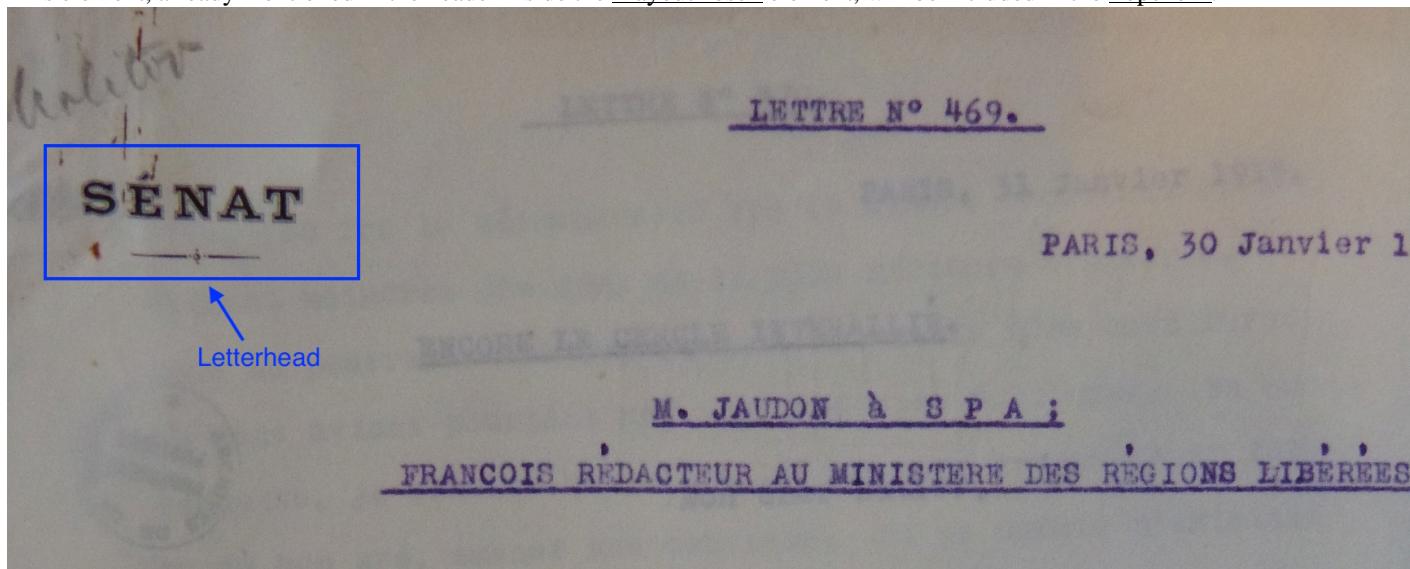

```

<hi rend="underline">SÉNAT</hi>
</fw>
<dateline rend="align(right)">
<placeName>Paris</placeName>, <date when-iso="1919-02-04">4 Février 1919</date>
</dateline>
<title rend="align(center)">
<hi rend="underline">LE PRÉSIDENT WILSON<lb/> REÇU A LA CHAMBRE DES
DÉPUTÉS</hi>
</title>
<salute rend="indent">Mon cher Butler,</salute>
</opener>
<opener>
<fw corresp="#lh-senat" place="margin"
type="letterhead">
<hi rend="underline">SÉNAT</hi>
</fw>
<dateline rend="align(right)">
<placeName>PARIS</placeName>, <date when-iso="1919-02-04">4 Février
1919</date>
</dateline>
<title rend="align(center) underline">LE PRÉSIDENT WILSON<lb/> REÇU A LA CHAMBRE DES DÉPUTÉS.</title>
<salute rend="indent">Mon cher Butler,</salute>
</opener>

```

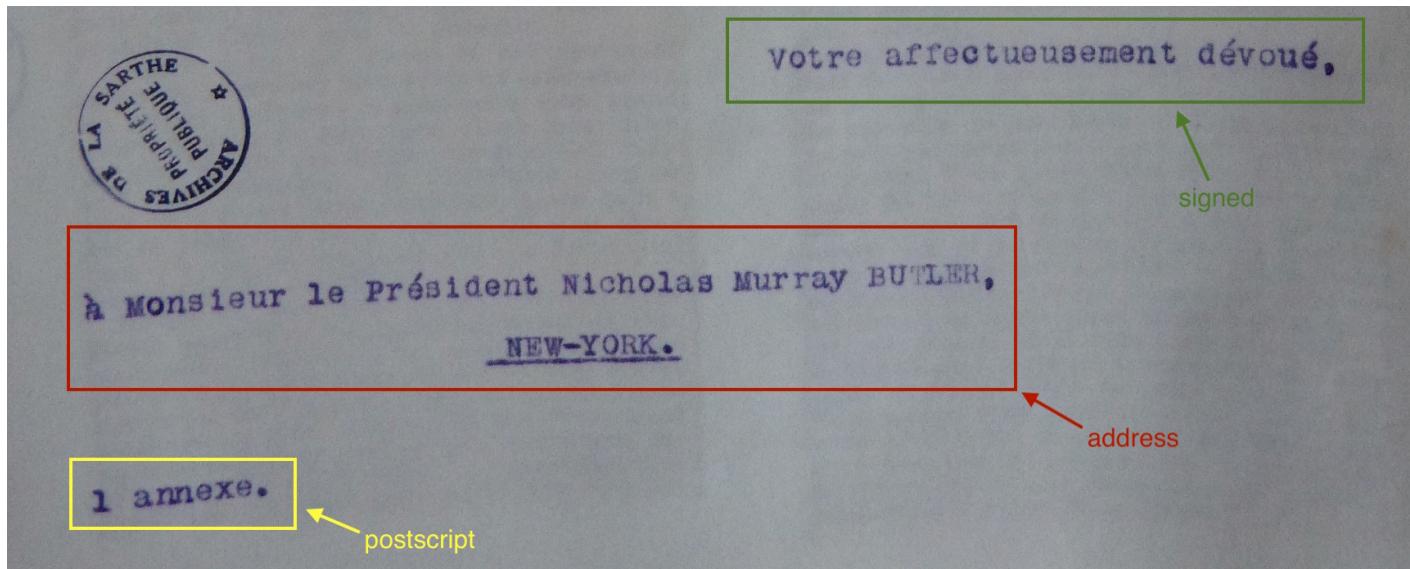

2.2.2.2. Letterheads : <fw>

In some letters or other documents, it is possible to find support with letterheads on the first page of the document. This element, already mentioned in the header inside the <layoutDesc> element, will be included in the <opener>.

We use the <fw> element, associated with multiple attributes : *type* indicates that we have a letterhead, *place* indicate the position of the letterhead on the paper and *corresp* links it to the *xml:id* defined in the header (see example above).

2.2.2.3. Closer: <closer>

Similarly, the TEI guidelines say: “`<closer>` groups together salutations, datelines, and similar phrases appearing as a final group at the end of a division, especially of a letter”. `<salute>` may also be used for the final salutations, `<signed>` for the signature. It is also possible to have a `<dateline>` at the end of a letter. Postscripts are encoded within the `<postscript>` element. We only integrate the specified elements in the `<closer>`, primarily the last salutations. Different (preceding) content in the last paragraph is not part of the `<closer>`, but of the running text. For example:

```
<closer>
<signed rend="align(right)">Votre affectueusement dévoué</signed>
<address>
<addrLine rend="margin">à Monsieur le Président Nicholas Murray BUTLER,</addrLine>
<addrLine rend="indent">
<hi rend="underline">NEW-YORK.</hi>
</addrLine>
</address>
</closer>
<postscript>
<p rend="margin">1 annexe.</p>
</postscript>
```

In some cases, it is possible to find multiple `<closer>` and `<postscript>`, overlapping one another. In this case, it is possible to have them more than once. For example :

```
<closer>
<signed rend="align(right)">Votre affectueusement dévoué,</signed>
<signed hand="#annotation"
      rend="align(right)">d'Estournelles de Constant</signed>
</closer>
<postscript>
<label place="margin">P.S.</label>
<p rend="indent">,- A mon passage à Paris, [...] et pourra sauver le Monde.</p>
</postscript>
<closer>
<signed hand="#annotation"
      rend="align(right)">E</signed>
<address>
<addrLine rend="margin">à Monsieur le Président Nicholas Murray BUTLER,</addrLine>
<addrLine rend="indent">
<hi rend="underline">NEW-YORK.</hi>
</addrLine>
</address>
</closer>
<postscript>
<p rend="margin">2 annexes.</p>
</postscript>
```

2.2.4. Addresses: `<address>`

Addresses are not necessarily specific to letters but appear most often in letters. We use the `<address>` element for denoting addresses appearing on manuscript pages. Its lines are included in `<addrLine>` elements, without `<lb>` between them (see the exemple above).

2.2.3. Displaying changes in the text

2.2.3.1. Changes in the manuscript: `<subst>`, `/<add>`

Our documents are mostly handwritten manuscripts, so they all contain deletions and additions. For these—apart from transpositions (see below)—, we use the element couple of `` and `<add>`. If the deletion or addition is made by a different hand than the surrounding text, then these elements are used with the attribute *hand* pointing to the corresponding `<handNote>` element in the header:

```
<del rend="strikethrough" hand="#red">Werd ich denn hier nun endlich etwas finden?</del> Ich war <add place="above" hand="#minor_hand">da</add>
```

For the *rend* attribute of ``, the following values are recommended (other values may be used if appropriate):

- strikethrough
- overwritten
- erasure
- none (e. g. if the deletion is only marked by writing the correct word alongside)

For the *place* attribute of `<add>`, the following values are recommended (other values may be used if appropriate):

- across (used in combination with `<del rend="overwritten">`)
- above
- below
- bottom
- top
- margin (may—but does not need to—be more specific: margin-left, margin-right, margin-top, margin-bottom denote which margin it is, and combining these values with ...-horizontal and ...-vertical denotes whether the text is written horizontally or vertically (margin-left-horizontal, margin-left-vertical, margin-right-horizontal and so on).)
- opposite
- overleaf

- end
- inline (if the text is simply written in the line, usually when some text immediately before has been struck through)
- inspace (in a predefined space, for example left by an earlier scribe)
- dots (if the text was first deleted and then marked to be included again by writing dots below it; see below for examples of nesting of additions and deletions)

In case of footnotes or other margin notes that have a numbered or otherwise labeled anchor in the main text, the attribute *n* may be used with <add> to give the label. In case of strikethrough text, it is sometimes hard to decide how precise to be when encoding a manuscript. Taking a close look at a manuscript page, one can see in many cases that words are actually not completely strikethrough although they are meant to be because the author of course did not use a ruler for striking out. For high precision, the parts (sometimes only one or two letters) that are actually not strikethrough may be marked using *rend*=“none”:

```
<del rend="none">str</del>
<del rend="strikethrough">ikethrough
  text</del>
```

However, it is left to the encoder to decide whether he really wants to be that precise or simply use *rend*=“strikethrough” all the way through. If a passage is stroke out so strongly that it cannot be identified anymore, this is indicated by using in combination with <gap>, <supplied> or <unclear>. See this example:

```
<del rend="strikethrough">
  <gap reason="strikethrough" />
</del>
```

The <subst> element groups a combination of deletion and addition in case they definitely belong together:

```
<subst>
  <del rend="strikethrough">ressener</del>
  <add hand="#annotation" place="above">resserrer</add>
</subst>
```

Sometimes, additions and deletions are nested in themselves: Some text had been added that was (partly) deleted afterwards, or some text had been deleted that was marked for inclusion again afterwards (for example by writing dots below it). For these cases, we use two basic rules [Note: For simplicity reasons, *rend* and *place* are missing in the following examples but should always be used, of course.] :

1. A <add>B</add> C

means that “A C” was written first, then “B” was added in its middle, then everything was deleted.

```
<del>
  <add>A</add>
</del>
```

means that “A” was once written as an addition but then, the whole addition was deleted.

```
<add>
  <del>A</del>
</add>
```

means that “A” was first deleted but then marked as to be included again.

2. If rule 1 cannot be obeyed, then the attribute *seq* is used to denote the sequence of the additions and deletions:

```
<add seq="1">A <del seq="2">B</del>
C</add>
```

means that “A B C” was once written as one large addition but then, the “B” part was deleted (and not the other way round as it would be if there was no *seq* attribute).

seq may use higher numbers in case more than two additions and deletions are nested.

Sometimes, additions and deletions may also be nested with (parts of) other elements. If, however, an addition or deletion goes over such (parts of) other elements in a way that <add> and cannot be used with proper XML nesting, <addSpan> and <delSpan> are used with the same attributes and with <anchor>. In the unusual case that something was overwritten but it cannot be told which was first and which is the text that was written over it, *seq*=“0” is used. See this example where a comma and a dash stand in the same place:

```
<subst>
  <add seq="0">,</add>
  <del seq="0">-</del>
</subst>
```

This is a bit of tag abuse because it actually cannot be told which is deleted and which is added, but there are no other elements available. Thus, we use *seq*=“0” to indicate that actually no sequence can be given.

Regarding additions on the margin and footnotes, we have encountered some more unusual cases and errors in the manuscripts and describe them like this:

- If there are two margin note marks in the text but only one note on the page (i. e. if the note could either belong into this or that place), we use a pointer: In one of the places, we give the <add> element an *xml:id* and *type*=“multiple-anchors” :

```
text <add xml:id="myID" type="multiple-anchors">addition</add>
```

```
text
```

In the other place, we use <add> with *type*=“multiple-anchors”, too, and inside, there is a <ptr> pointing to the other <add>:

```
text <add type="multiple-anchors">
<ptr target="#myID"/>
</add>
text
```

- If there is a margin note mark in the text but no actual note, we use <add> with *type*=“no-anchor” and a non-pointing <ptr>:

```
text <add type="no-anchor">
<ptr type="none"/>
</add>
text
```

2.2.3.2. Textual transpositions: <transpose>

In some cases, an author has written two or more parts of text which he later decides to give a different order. Sometimes, he does not denote that by deleting the parts and writing them completely again, but by using some mark to denote change of order. For such transpositions, we do not use <subst>, and <add>, but <transpose>. See this example:

```
<seg xml:id="ib01">dann</seg>
<seg xml:id="ib02">erst</seg>
<listTranspose>
  <transpose>
    <ptr target="#ib02"/>
    <ptr target="#ib01"/>
  </transpose>
</listTranspose>
```

The author has first written “dann erst”, but then decided that it should be “erst dann”. The two parts “dann” and “erst” are included in <seg> elements each with an *xml:id*. Immediately afterwards, follows with a single <transpose> element containing a pointer (<ptr>) to each part in the order that the author has settled on.

2.2.3.3. Shift of hand: <handShift>

Sometimes, the hand changes in a way that cannot be dealt with using the *hand* attribute with some element. For example, if the author had stopped writing at some point and completed the text on another day using different ink, then this change of hand may obviously not be marked as an addition or a note using <add> or <note>. In those cases, we use the empty element <handShift> to denote a shift of hand:

```
This part is written in black ink (default hand). <handShift new="#red"/> This part is written in red ink.
```

The attribute *new* points to the corresponding <handNote> element in the header, as does *hand* within <add>, <note> or other elements. Please note that <handShift> is meant as a switch that is turned at the point where it appears and never goes back to its original position unless another <handShift> element appears. This means that <handShift> does not obey XML hierarchies. In following example, the hand “#red” runs until the second <handShift> element appears and does not stop at the closing <hi>:

```
This part is written in black ink (default hand). <hi rend="underline">This part is written in black ink and is underlined<handShift new="#red"/> and this part is written in red ink and is still underlined.</hi> This part is written in red ink. <handShift new="#major_hand"/> This part is written
```

2.2.3.4. Corrections made by us: <choice>, <sic>/<corr>

We do not normalize spelling. We do correct syntactical mistakes on the basis of the final text, i. e. with all additions and deletions carried out [*Note: Syntactical mistakes usually happen when the author makes additions or deletions changing the structure of a sentence and does not notice that some word forms needed to be changed, too.*]. For this, <choice> is used with <sic> and <corr>:

```
<choice>
  <sic>geworden</sic>
  <corr>wurden</corr>
</choice>
```

2.2.3.5. Abbreviations:<choice>, <abbr>/<expan>

We expand abbreviations using <choice>, <abbr> and <expan>:

```
<choice>
  <abbr>phil.</abbr>
  <expan>philosophische</expan>
</choice>
```

2.2.4. Displaying specific parts of the text

2.2.4.1. Dashes and hyphens

We differentiate dashes and hyphens the following way:

- - is the single hyphen (“-”).
- # is the double hyphen (“=”, not the equal sign)
- – is the en-dash (“–”, German “Gedankenstrich”).
- — is the em-dash (“—”).
- # is the mathematical minus sign.

End-of-line hyphenation is treated differently. See below for an explanation of the difference between the numerical and the letter-based (entity) references for the dashes and the minus sign.

2.2.4.2. Special characters

Every character available in Unicode can be typed in as-is because all our XML documents are UTF8-encoded. If, however, an encoder cannot type in a character because it is not available on their keyboard, two means of referencing it are possible:

- XML numeric character reference where nnnn are up to four decimal digits describing the Unicode code point of the character.
- XML character entity reference where abcde are letters. We use the character entity references defined in HTML, although they are not part of XML nor TEI. Currently, we have not defined these entities in our schema so our documents are not technically valid during editing, but the entity references are transformed into numeric references before publication.

The full list of special characters is given in https://en.wikipedia.org/wiki/List_of_XML_and_HTML_character_entity_references and https://en.wikipedia.org/wiki/List_of_XML_and_HTML_character_entity_references

2.2.4.3. Space

A non-breaking space is a space that must never be used for a line break. It is denoted by :

S. 159

Space appearing inside a line for a reason can be denoted using the `<space>` element:

```
<space extent="two words"/>
<space extent="two words" rend="_"/>
<space extent="two words" rend="-"/>
```

`extent` and `rend` may be used. The first example denotes an empty space. The second example denotes a space which uses underscores on the manuscript page as placeholders. The third example denotes a space which uses en-dashes. Do not confuse `<space>` with `<gap>`: `<space>` is for space found in a line deliberately placed there by the writer, `<gap>` is for parts that contain text that cannot be transcribed.

2.2.4.4. Unidentifiable glyphs: `<g>`

We have decided not to describe unidentifiable glyphs (i.e. symbols that apparently do not belong to any language) any further because they can be viewed in the facsimile. Instead, we only use `<g>` with `type="unknown"` to denote that the glyph is there:

```
text text <g type="unknown"/> text text
```

2.2.4.5. Hard-to-read passages: `<unclear>`, `<supplied>`, `<gap>`

The `<unclear>` element with the attributes `cert` and `reason` is used for passages that are difficult to read:

```
<unclear cert="medium" reason="stain">nur</unclear>
```

Sometimes, it happens that a hard-to-read passage could be either this or that. In those cases, `<unclear>` can be used with `<choice>`:

```
der <choice>
  <unclear reason="illegible" cert="high">den</unclear>
  <unclear reason="illegible" cert="low">dem</unclear>
</choice> Derwisch
```

Here, it is recommended to use `cert` to give one possible version a high and the other one a low certainty. `cert="high"` here means, however, that there is a high likelihood for the passage to be the version described—and not that the certainty of unclarity was high. The same goes for `cert="low"`, respectively. When the editor could not decide to give one version a higher possibility than the other one, `cert="medium"` may be used twice, but this is not recommended. For illegible passages or when a piece of text is missing, we use the `<gap>` element. It uses the attributes `extent` to denote the length of the missing part and `reason` as does `<unclear>`, but is an empty element(
[Note: As opposed to `<unclear>`, it is mandatory for `<gap>` to have `extent` specified. For `<unclear>`, the `extent` can usually be seen from the text that it includes. In rare cases, however, `extent` may also be given for `<unclear>`, for example when it is unsure whether the unclear part is actually 3 or 4 characters long.]):

```
<gap extent="two words" reason="illegible"/>
```

If the editor decides that he knows or can guess the text that is missing, then he may use `<supplied>` instead of `<gap>` to supply the missing text. `<supplied>` has the same attributes as `<unclear>`:

```
leur <supplied reason="stain">raison</supplied> fait
```

The difference between `<unclear>` and `<supplied>` is that the first is used when the text is hard to read but still legible and the latter is used as a replacement for `<gap>` when the text is completely illegible or missing. The following values for `reason` in `<unclear>`, `<gap>` and `<supplied>` are currently recognized in the web interface and translated automatically into German and French for display:

- border/bound/binding
- crease/folding/angled
- damage
- erasure/strikethrough

- faded
- illegible/not... legible
- hole (without the word seal)
- incomplete
- lost
- overlapping folio
- overwritten
- paper missing
- seal
- smudged
- stain
- tape
- wax

Other values may be used if appropriate.

Do not confuse `<gap>` with `<space>`! `<gap>` is for parts containing text that cannot be transcribed, `<space>` is for space found in a line deliberately placed there by the writer.

2.2.4.6. Highlighted text: `<hi>`

We only use the `<hi>` element, which, according to the TEI guidelines, “marks a word or phrase as graphically distinct from the surrounding text”. A change of scripture is indicated with `<hi>`, too (for example if one word is written in “Latin” and the rest of the text in “Kurrent” scripture). We add the *rend* attribute which can adopt several values. For example:

```
<hi rend="underline">ils ont oublié  
les relations entre les peuples !</hi>
```

The following values are recommended for *rend*:

- underline (with *n* indicating how often the word is underlined; if *n*=1, then it may be left out)
- superscript
- subscript
- small
- large
- quoted
- majuscule
- latin (if the respective text is written in “Latin” scripture as opposed to “Kurrent” scripture surrounding it)
- kurrent (if the respective text is written in “Kurrent” scripture as opposed to “Latin” scripture surrounding it)
- mark (if there is a vertical line to mark a part of the text)
- upsidedown

`<hi>` may be used with *hand* to denote the hand which has done the highlighting if it is not the hand that has written the highlighted text. *hand* corresponds with `<handNote>` in header as it does in the `<add>` and `<note>` elements.

2.2.4.7. Horizontal alignment

Almost every element may use the *rend* attribute to denote its horizontal alignment. See these examples:

```
<dateline rend="align(right)">Dresden den 6t October.  
23</dateline>  
<title rend="align(center)">L'ARMÉE de DEMAIN .</title>
```

The following values are used:

- align(center) (centered text)
- align(right) (right-aligned text)

Left-aligned text is not denoted because it is the default. Apart from that, some elements, for example `<hi>`, use *rend* for other purposes. Please note that if because of this, an element has two values for *rend*, the following is not allowed because an attribute may not appear more than once for an element in XML:

```
<! -- WRONG!  
<hi rend="kurrent" rend="align(center)">...</hi>-->
```

This, however, is correct:

```
<hi rend="kurrent align(center)">...</hi>
```

2.2.4.8. Lists: `<list>`

Lists should be encoded with the `<list>` element:

```
<list>
  <label>1)</label>
  <item>die Rechtslehre,</item>
  <lb/>
  <label>2)</label>
  <item>die philosophischen Briefe,</item>
  <lb/>
  <label>3)</label>
  <item>über die Mythologie,</item>
</list>
```

The labels given inside the `<label>` element must really exist in the document. The `<label>` element must not be used if they don't appear in the source.

2.2.4.9. Citations: `<cit>`, `<quote>`

Parts that the author of a manuscript has cited from another source are included in `<cit>` and `<quote>`. If no bibliographic reference is given in the manuscript, we write the reference ourselves and include it in a `<note>` with `resp`. See this example:

```
<cit>
  <quote>
    <lg type="poem">
      <1>da nun die Liebe haucht in die Gedanken</1>
      <1>Ich werde kunstvoll gut gesetzt an Jahren</1>
    </lg>
  </quote>
  <note resp="#sabine.seifert">
    <persName ref="#p0237">Chamisso</persName> zitiert aus dem Gedicht <title ref="#w00260">Erfüllung</title> von <persName ref="#p0249">Karl August Varnhagens vorliegt (S. 102). Hier lautet die letzte Strophe: "Doch nun die Liebe haucht in die Gedanken, / Naht schnell begehrter Ufer ferne Weite, / Ich werde kunstvoll, gut, gesetzt von Jahren."</note>
  </cit>
```

2.2.4.10. Dates: `<date>`

We place dates in a `<date>` element and add a standardized form. Two examples:

```
<date when-iso="1823-10-06">den 6t October. 23</date>
<date notBefore="1824" notAfter="1825">1824-1825</date>
```

2.2.4.11. Named entities: Persons, organizations, places, works

Every time, a name of a person, an organization, a place or a work appears in a text, it gets marked using `<persName>`, `<orgName>`, `<placeName>` or `<title>`, respectively. For every such entity, an entry in the corresponding index is created including an `xml:id` that has a specific format. From inside the text, the name is linked with the index entry using the `ref` attribute which points to the corresponding `xml:id`. For example:

```
<placeName ref="#10003">Dresden</placeName>
<orgName ref="#o0001">Humboldt-Universität zu Berlin</orgName>
<persName ref="#p0003">Sofokles</persName>
<title ref="#w0010">Nachgelassene Schriften und Briefwechsel</title>
```

However, it sometimes happens that the author writes about a person, an organization, a place or a work without quoting their name. We can't use the elements `<persName>`, `<orgName>`, `<placeName>` or `<title>` in those cases, because there is neither a name nor a title. Instead, the `<rs>` ("referencing string") element can be applied:

```
<rs ref="#p0002">Bruder</rs>
```

2.2.4.12. Parts in different language: `<foreign>`

The majority of the documents is written in German or French. We specify the document's languages in the `<profileDesc>` as part of the TEI header.

To denote the actual parts of the text written in another language than its main language, we add an `xml:lang` attribute to the correspondent element (`<div>`, `<p>`, `<hi>`, ...). If there is no element directly corresponding with the change of language, we use the `<foreign>` element with `xml:lang` as its attribute.

As defined in the XML standard, value of the attribute is the code of the language according to IETF's BCP 47. In our case, it usually has only one part—the code of the language according to ISO 639. For example:

```
<foreign xml:lang="la">malus</foreign>
```

2.2.5. Using the `<note>` element

2.2.5.1. Notes: `<note>`

We distinguish two types of notes—but use the `<note>` element for both of them.

On the one hand, there are notes that appear on the manuscript page. They can be written by the author/sender himself, by a publisher, by an archivist, and so on. We use the attribute `hand` to link them to a hand that is described in a `<handNote>` element. The `place` attribute can adopt the same values as it can in the `<add>` element. Signatures of archives are marked using the `type` attribute.

On the other hand, there are notes that we write ourselves. They do not appear on the manuscript page, of course. For these notes, we do not use `hand`, but `resp` to link the note with the person that has written it, i.e. with their entry

in the index of contributors. If a note written by us should appear only in one of the two display versions in the web interface, this may be indicated using *subtype*:

```
<note resp="#sabine.seifert" subtype="1">only in version 1 (Diplomatic  
version)</note>  
<note resp="#sabine.seifert" subtype="2">only in version 2 (Reading version)</note>
```

Both the `<note>` and the `<add>` element may describe additions. As it is difficult to know how to distinguish between cases where `<note>` should be used and cases where `<add>` should be used, we have decided that this cannot be told for the whole edition and thus settled on making this decision dependent on the habits of each author—except for two project-wide rules:

- If an addition directly and definitely belongs together with a deletion, then `<add>`, `` and `<subst>` are always used.
- For margin notes (those with *place*=“margin” and so on), `<add>` is used if the addition has a determinable anchor in the text, i. e. if it grammatically and/or semantically belongs into a certain position in the text that can be clearly identified. Otherwise, then `<note>` is used.

2.2.5.2. Foliation numbers: `<note>`

We also use the `<note>` element to denote foliation numbers found on the manuscript page or made by us (e. g. if the foliation on the manuscript is wrong). They are marked using *type*=“foliation”. As with other notes, they are linked with *hand* or *resp*, depending on who made them. For example:

```
<note type="foliation" hand="#red">Foliation number on the manuscript page</note>  
<note type="foliation" hand="#pencil">Other foliation number on the manuscript page</note>  
<note type="foliation"  
resp="#johanna.preusse">A foliation made by us</note>
```

2.2.5.3. Logical text structure: `<note>`

Furthermore, the `<note>` element may be used with *type*=“structure” to denote numbers or other means of text structuring in a logical way :

```
<head>  
  <note type="structure"  
    resp="#johanna.preusse">2. Akt</note>  
</head>
```

2.2.6. Linking entities

2.2.6.1. Pointers inside one manuscript : `<ref>`

A different location inside the same manuscript can be referenced by giving the element that is being pointed to an *xml:id* and using `<ref>` with *target* from another location to point to it. See the example: This is the element that is being pointed to:

```
<pb n="4" facs="00000170.jpg"  
  xml:id="Brief001ChamissoandeLaFoye-Blatt4v"/> This is the pointer:  
<accMat>  
  <ref target="#Brief001ChamissoandeLaFoye-Blatt4v">Blatt 4v</ref> dient als Briefumschlag.  
</accMat>
```

As *target* points to a location within the same XML tree, # appears as its first character.

2.2.6.2. Pointers to other manuscripts of the edition: `<ref>`

Other manuscripts of our edition are referenced using `<ref>` with *target* containing the file name of the manuscript:

```
<origin>  
  <seg xml:lang="de">  
    <persName ref="#p0237">Chamisso</persName> eigenhändige Abschrift dieses Briefes hat  
    möglicherweise dem Brief an <persName ref="#p0248">de La Foye</persName> (ohne Ort und Datum, <ref target="Brief027ChamissoandeLaFoye.xml">B  
    anfertigte, ist nicht eindeutig zu bestimmen. </seg> ...  
</origin>
```

This may be combined with a pointer to a position inside the other manuscript:

```
<ref target="Boeckh_Buchkatalog.xml#book-4">Nr. 4 im Katalog meiner  
Bücher</ref>
```

2.2.6.3. Pointers to HTTP URLs: `<ref>`

`<ref>` with *target* is also used for pointing to HTTP URLs. This occurs most often in notes that are written by us and in the header.

```
<note resp="#lena.ebert">Im <ref target="http://woerterbuchnetz.de/DWB/">Deutschen Wörterbuch von Jacob und  
Wilhelm Grimm</ref> [Zugriff 17.07.2012] findet man für "Maultasche" auch die Bedeutung  
<quote>"klatschender schlag aufs maul"</quote>, in welcher <persName ref="#p0237">Chamisso</persName> das  
Wort sicherlich verwendet.</note>
```

3. Index encoding

The digital edition includes five indexes:

- index of persons
- index of organizations
- index of places

- index of works
- index of contributors (to the digital edition)

One XML document is created for each of the indexes. This is the skeleton of each of the index documents:

```
<teiHeader>
<fileDesc>
<titleStmt>
<title>Index ...</title>
<funder>Ministère de l'Enseignement supérieur, de la Recherche et de l'Innovation (MESRI)</funder>
<principal>
<persName ref="#anne.baillot">
<forename>Anne</forename>
<surname>Baillot</surname>
</persName>
<affiliation>
<orgName ref="#hu.berlin">Humboldt-Universität zu Berlin</orgName>
<address>
<street>Unter den Linden 6</street>
<postCode>10099</postCode>
<settlement>Berlin</settlement>
<country key="DE">Deutschland</country>
</address>
</affiliation>
</principal>
<!-- <respStmt>...</respStmt> -->
</titleStmt>
<publicationStmt>
<publisher>Projet DAHN</publisher>
<availability>
<licence target="https://creativecommons.org/licenses/by/3.0/deed.en">Attribution 3.0 Unported (CC BY 3.0)
</licence>
</availability>
<date when-iso="...">>...</date>
</publicationStmt>
<seriesStmt>
<title type="main">Correspondances de Paul d'Estournelles</title>
</seriesStmt>
<sourceDesc>
<p>Born digital</p>
</sourceDesc>
</fileDesc>
<revisionDesc>
<change when-iso=" " who="#name.surname">...</change>
</revisionDesc>
</teiHeader>
```

The TEI header is almost identical for all indexes. Please note that the `<sourceDesc>` element contains only one line: “born digital”, because it originates in a digital form. The indexes are included inside the `<body>` element, i.e. the elements `<listPerson>`, `<listOrg>` and so on are direct sub-elements of `<body>`.

3.1. Index of persons

The index of persons comprises any person appearing in our texts, whether as an author, as an addressee of a letter, otherwise involved or simply mentioned in a manuscript. This index is to be distinguished from the index of contributors listing persons who have worked on this edition, which is explained in another section.

3.1.1. `<listPerson>`

The index consists of a `<listPerson>` element which contains one `<person>` element for each person described and one `<listRelation>` element for describing all relationships between persons. This is the basic structure whose elements are described in more detail below:

```
<listPerson>
<person xml:id="...>
<persName>
<forename>...</forename>
<surname>...</surname> ...
</persName>
<birth>
<date when-iso="..."/>
<placeName>...</placeName>
</birth>
<death>
<date when-iso="..."/>
<placeName>...</placeName>
</death>
<sex value="1"/>
<occupation>...</occupation>
<education>...</education>
<affiliation>...</affiliation>
<event>...</event>
<idno type="...">>...</idno>
</person>
<person xml:id="...">> ...
</person>
<listRelation>
<relation name="..." active="... ..." 
passive="... ..."/>
<relation name="..." mutual="... ... ..."/> ...
</listRelation>
</listPerson>
```

3.1.2. `<person>`

Every `<person>` element has an `xml:id` attribute used for referencing the person from the manuscript texts and other places whose value is composed of “p” plus four different digits:

```
<person xml:id="p0001">
<persName>
<roleName type="nobility">Baron</roleName>
```

```
<forename>Paul</forename>
<nameLink>d'</nameLink>
<surname>Estournelles de Constant</surname>
</persName>
</person>
```

The following information can be given inside of `<persName>`:

- `<forename>` is used for the first name. It can be completed by a `type` attribute in order to precise whether this is the name usually used, the second name etc.
- `<surname>` is used for the family name. It can be completed by a `type` attribute in order to precise whether this is a maiden or married name (`type="maiden"` or `type="married"`).
- `<nameLink>` is used for the link in aristocratic names.
- `<addName>` is used for a nickname or alias.
- `<roleName>` with `type="honorific"` is used to indicate academic titles that are “Dr.” or on a higher level than that.
- `<roleName>` with other values of `type` is used indicate functions such as king, pope, princess(*[Note: This role has to be indicated if it's used as a way to distinctly designate the person and not be just a role in general]*)
- `<genName>` is used in order to distinguish between identical names belonging to different persons (in case of a difference of generation etc.), for example if there is a number after the first name of kings or the words “junior” and “senior”.

For example:

```
<persName>
  <forename>Stanislaus</forename>
  <genName>II.</genName>
  <addName>Augustus</addName>
  <surname>Poniatowsky</surname>
  <roleName type="nobility">King of Poland <date when-iso="1764/1798">1764-1798</date>
  </roleName>
  <roleName type="nobility">Grand Duke of Lithuania</roleName>
</persName>
```

Apart from the name, we encode the following information on persons inside a `<person>` element:

- information on birth using `<birth>` with `<date>` and `<placeName>` inside.
- information on death using `<death>` with `<date>` and `<placeName>` inside.
- sex using `<sex>` with `<sex value="1">` for a male person and `<sex value="2">` for a female person.
- occupations using the `<occupation>` element. Any kind of occupation or profession can be encoded here. Thus, `<occupation>` may appear more than once.
- affiliations using the `<affiliation>` element.
- `<orgName>` can be used inside this element in order to denote the name of an organization and to provide a pointer to the corresponding entry in the index of organizations. `<placeName>` may also be used if appropriate. `<affiliation>` can appear more than once.
- educational experiences using the `<education>` element. Inside, `<placeName>` and `<orgName>` can be used, too, when appropriate. `<education>` can appear more than once.
- other events related to that person using the `<event>` element.
- authority file number using the `<idno>` element to reference the person mentionned. Among the authority file available, you can for example choose the PND Number which is maintained by the German National Library or the VIAF, which is an international authority file operated by the Online Computer Library Center.

For every element, we can use the attribute `cert` to indicate the degree of certainty associated with its content. We use the values high, medium and low. When no `cert` attribute is given, this means that the content is definitely certain.

Dates are encoded inside `<date>` with the appropriate attributes according to the guidelines. Dates inside `<birth>` and `<death>` don't need to be repeated as textual content of the `<date>` element because for the indices, the textual content is not shown in the web interface anyway.

Thus, this is correct:

```
<birth>
  <date when-iso="1730-08-19" />
</birth>
```

... but this is superfluous:

```
<birth>
  <date when-iso="1730-08-19">19.
    August 1730</date>
  </birth>
```

3.1.3. <listRelation>, <relation>

Relationships between persons are encoded using <relation> elements that appear inside one <listRelation> which is included in <listPerson> after all <person> elements. Here are some examples:

```
<relation name="parent"
  active="#p0001 #p0002" passive="#p0003 #p0004" />
<relation name="spouse"
  mutual="#p0001 #p0002" />
<relation name="lover"
  mutual="#p0001 #p0006" />
<relation name="teacher" active="#p0006"
  passive="#p0004" />
```

These examples indicate the following: Persons 1 and 2 are parents of persons 3 and 4. Persons 1 and 2 are also married. Person 1, however, has a lover which is person 6. Person 6 is also a teacher of person 4.

Names of relations (in the *name* attribute) can be chosen as appropriate. For reasons of uniformity, we do not use the inverse relationships “child” (use parent instead) and “student” (use teacher instead).

3.2. Index of organizations

3.2.1. <listOrg>

The index of organizations is contained in a <listOrg> element. Inside, there is one <org> element for each organization.

It would be better to have two <listOrg> element, containing each a set of organizations. One would contains the organizations mentioned in the corpus that would then be referenced in the corpus. The other would contains the organizations linked to the project and its contributors. It would then be all the organizations mentioned in the index of contributors and the organizations mentioned in the metadata, like the institution where a document from the corpus is stored (in the <msDesc>).

3.2.2. <org>

Every <org> element have *xml:ids* that are composed of a simplified version of the organisation name, but still identifiable.

Inside <org>, there is a <orgName> to specify the name of the organization and its date of creation and it is followed by a <desc> element to present briefly the organization. There is also a <placeName> to localise the organization (the place, the country and the location). Finally, just like for the <person>, there is the <idno> element that links the organization to an authority file. For example :

```
<org xml:id="carnegie_endowment">
<orgName from-iso="1910">Carnegie Endowment for International Peace</orgName>
<desc>Conducts research programs, discussions, publications on international affairs and the american foreign policy. Until 1948, it was composed of 3 divisions: Intercourse and education, Economics and history, International law.</desc>
<placeName from-iso="1910"
  notAfter-iso="1948">
<placeName>Peter Parker House</placeName>
<country>United States of America</country>
<location>
<geo>38.90931 -77.04112</geo>
</location>
</placeName>
<idno type="VIAF">144086141</idno>
</org>
```

3.3. Index of places

3.3.1. <listPlace>

The whole index of places is contained in one <listPlace> element. Inside, there is one <place> element for each place.

3.3.2. <place>

Places have *xml:ids* that are composed of “l” (location) plus four digits. It has a *type* attribute specifying the type of location (city, country, region...). Inside <place>, at least one name is given inside <placeName>. Other names, for example in different languages, may be added. After that, GPS coordinates for the place are included inside <location> and <geo>. Those coordinates have to be in decimals or a map will not be able to interpret them. Finally, we can also have an <idno> with an attribute *type*=“geonames” to reference the place with its identifier from the geographical database.

See this example of a full entry in the index of places:

```
<place type="region" xml:id="10972">
<placeName xml:lang="en">Sardinia</placeName>
<placeName xml:lang="de">Sardinien</placeName>
<placeName xml:lang="fr">Sardaigne</placeName>
<location>
```

```
<geo>40.027778 9.069444</geo>
</location>
<idno type="geonames">2523227</idno>
</place>
```

3.4. Index of works

This index gathers works, monographs, articles, journals ..., shortly all objects that can be described bibliographically. Every title has an *xml:id* attribute whose value is composed of “w” (work) plus five digits.

3.4.1. <listBibl>

The whole index is contained in one *<listBibl>* element. Inside, there is one element *<biblStruct>* for each title. The structure of *<biblStruct>* depends on the type of work. For non-independent publications, i. e. articles within a monograph or journal, the basic structure is as follows:

```
<biblStruct xml:id="w...">
  <analytic>
    <author ref="#p..."><...></author>
    <title>...</title>
  </analytic>
  <monogr>
    <editor ref="#p..."><...></editor>
    <title ref="#w..." level="..."><...></title>
    <imprint>
      <biblScope unit="volume">...</biblScope>
      <biblScope unit="page">...-...</biblScope>
      <pubPlace ref="#l..."><...></pubPlace>
      <publisher>...</publisher>
      <date when-iso="..."/>
    </imprint>
  </monogr>
</biblStruct>
```

<analytic> contains the *<author>* and *<title>* of the article. *<monogr>* in this case contains information on the independent item inside which the article was published. *<editor>* is usually used here, it may have a *role* attribute to specify the role of the person. The *<title>* inside *<monogr>* always has the attribute *level* where the type of publication is specified. *level=j* is used for journals, *level=m* is used for books (monographic title), *level=p* is used for “Seminararbeiten” (non-journal papers made in university courses). *ref* is used if the monographic item itself appears in the index of works and then points to its entry. See the below example of a monographic item for an explanation of further elements that may appear inside *<monogr>*. Afterwards, *<imprint>* follows using *<biblScope>*, *<pubPlace>*, *<publisher>* and *<date>*, as specified in the TEI guidelines. For monographic items, *<biblStruct>* looks as follows:

```
<biblStruct xml:id="w...">
  <monogr>
    <author ref="#p..."><...></author>
    <editor ref="#p..." role="..."><...></editor>
    <title level="m"><...></title>
    <title level="m" type="sub"><...></title>
    <edition n="..."><...></edition>
    <editor ref="#p..." role="..."><...></editor>
    <imprint>
      <pubPlace ref="#l..."><...></pubPlace>
      <publisher>...</publisher>
      <date when-iso="..."/>
    </imprint>
    <extent unit="volume">2</extent>
  </monogr>
</biblStruct>
```

Only *<monogr>* appears here. Its structure is the same as above. *<author>* and *<editor>* are used if appropriate, the position of the latter depending on whether the work as is or only the specific edition was published by the editor. *<editor>* may use *role* as specified above. *<title>* must have the attribute *level=m* denoting that it is monographic item. Sub-titles are added using a further *<title>* element with the attribute *type=sub*. *<edition>* is used if appropriate. Towards the end, *<imprint>* follows with *<pubPlace>*, *<publisher>* and *<date>*. *<extent>* may be given to denote the size of the item, for example if it has more than one volume.

3.5. Index of contributors

Contributors have *xml:ids* that are composed of their forename, a dot and their surname.

It is structured like the index of persons, with a *<listPerson>* element and multiple *<person>* element. Inside each *<person>*, there is three elements :

- *<persName>*: it contains the *<forename>* and *<surname>*
- *<affiliation>*: it contains informations about the institute associated to the contributor, with the *<orgName>* element, with an organisation that will have to be declared in the index of organizations and the address for the location of the institute in a *<address>* element.
- *<occupation>*: it contains the occupation of the contributor within the project

```
<person xml:id="floriane.chiffoleau">
  <persName>
    <forename>Floriane</forename>
    <surname>Chiffoleau</surname>
  </persName>
```

```

<affiliation>
  <orgName ref="inria">Institut national de recherche en informatique et automatique (INRIA)</orgName>
  <address>
    <street>2 rue Simone Iff</street>
    <postCode>75012</postCode>
    <settlement>Paris</settlement>
    <country key="FR">France</country>
  </address>
</affiliation>
<occupation>Encodage du projet</occupation>
</person>

```

4. Encoding decisions for the whole edition

This section describes encoding decisions for certain elements that appear throughout the whole edition, i. e. in manuscripts as well as in indices and <teiHeader>s.

4.1. Dates

Dates can appear inside the elements <date>, <docDate> and <origDate>. We always give an ISO-8601-like standardized form like this:

```

<date when-iso="1823-10-06">den 6t October.
23</date>
<date when-iso="1824/1825">1824-1825</date>

```

Inside the indices, there need not be any textual content in most <date> elements because such content is not shown in the web interface anyway.

Thus, this is correct:

```

<birth>
  <date when-iso="1730-08-19"/>
</birth>

```

... but this is superfluous:

```

<birth>
  <date when-iso="1730-08-19">19. August
  1730</date>
</birth>

```

Because the TEI guidelines allow a number of attributes and ways of encoding a standardized form of the given date, we have decided not to use all of them, but always encode dates in this format:

- We always use the attribute *when-iso* for singular values and give the dates according to ISO 8601, that is to say in the following format: yyyy-mm-dd.
- When the only date element provided is a year, we will not use *when-iso* but simply *when*. We can then have two cases for the use of *when*. When the year is BC or in early century and it is not completely sure, the date will also have content to indicate approximation. When it is in more recent century, we will only have the date with the attribute.

```

<date when="0001">ca. 1 CE</date>
<date when="1622"/>

```

- For intervals, we use the attribute *notBefore* and *notAfter* or their more specific version *notBefore-iso* and *notAfter-iso*. It will depends on the accuracy of the dates. When the interval is two dates in yyyy-mm-dd format, we use the iso form of the attribute and with other cases, we use the plain format. In any of those cases, we will always have content inside the tag to write exactly what the intervals means, in order to display the correct information in the web interface. For example:

```

<date notAfter="-0420" notBefore="-0430">between 430 and 420 BCE</date>
<date notAfter="0100" notBefore="0001">2nd century CE</date>
<date notBefore="1824" notAfter="1825">1824-1825</date>

```

- Sometimes, there are also intervals because the encoder is uncertain of the exact date. In those cases, we will used the *notBefore* and *notAfter* attribute or the iso format if the uncertainty is between two exact dates. The uncertainty or approximation will be established with the content of the tag, by using words like "or", "probably" or "around". For example:

```

<date notAfter="-0396" notBefore="-0399">probably between 399 and 396 BCE</date>
<date notAfter-iso="1799-08-15">
  <date notAfter="1799-08-10">10 or 15 August 1799</date>
  <date notAfter="1805" notBefore="1804">1804 or 1805</date>
  <date notAfter="1525-01">
    notBefore="1524-12">December 1524 or January 1525</date>

```

- Dates may also refer to a different calendar, mainly to the French Revolutionary calendar. The value of *when-iso* always has to be in the form of the Gregorian calendar. The *calendar* attribute is used to denote that the date refers to another calendar. We use the value "french-rev-cal" for the French Revolutionary calendar:

```

<date calendar="french-rev-cal">

```

```
when-iso="1804-12-12">>21 frimaire</date>
```

5. XML template for egodocuments

```

6. List of the modules used on my TEI files

6.1. Elements

6.1.1. <TEI>

<TEI> (TEI document) contains a single TEI-conformant document, combining a single TEI header with one or more members of the `model.resourceLike` class. Multiple <TEI> elements may be combined to form a <teiCorpus> element. [4. Default Text Structure 15.1. Varieties of Composite Text]

Module	textstructure						
Attributes	<p>Attributes <code>att.global</code> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<code>att.global.rendition</code> (@rend, @style, @rendition)) (<code>att.global.linking</code> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<code>att.global.analytic</code> (@ana)) (<code>att.global.fac</code> (@fac)) (<code>att.global.change</code> (@change)) (<code>att.global.responsibility</code> (@cert, @resp)) (<code>att.global.source</code> (@source)) <code>att.typed</code> (@type, @subtype)</p> <p>version specifies the version number of the TEI Guidelines against which this document is valid.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td><code>teidata.version</code></td> </tr> <tr> <td>Note</td> <td>Major editions of the Guidelines have long been informally referred to by a name made up of the letter P (for Proposal) followed by a digit. The current release is one of the many releases of the fifth major edition of the Guidelines, known as P5. This attribute may be used to associate a TEI document with a specific release of the P5 Guidelines, in the absence of a more precise association provided by the <i>source</i> attribute on the associated <schemaSpec>.</td> </tr> </table>	Status	Optional	Datatype	<code>teidata.version</code>	Note	Major editions of the Guidelines have long been informally referred to by a name made up of the letter P (for Proposal) followed by a digit. The current release is one of the many releases of the fifth major edition of the Guidelines, known as P5. This attribute may be used to associate a TEI document with a specific release of the P5 Guidelines, in the absence of a more precise association provided by the <i>source</i> attribute on the associated <schemaSpec>.
Status	Optional						
Datatype	<code>teidata.version</code>						
Note	Major editions of the Guidelines have long been informally referred to by a name made up of the letter P (for Proposal) followed by a digit. The current release is one of the many releases of the fifth major edition of the Guidelines, known as P5. This attribute may be used to associate a TEI document with a specific release of the P5 Guidelines, in the absence of a more precise association provided by the <i>source</i> attribute on the associated <schemaSpec>.						
Contained by	<code>core: teiCorpus</code>						
May contain	<code>header: teiHeader</code> <code>textstructure: text</code> <code>transcr: facsimile</code>						
Note	This element is required. It is customary to specify the TEI namespace <code>http://www.tei-c.org/ns/1.0</code> on it, using the <code>xmlns</code> attribute.						
Example	<pre> <TEI version="3.3.0" xmlns="http://www.tei-c.org/ns/1.0"> <teiHeader> <fileDesc> <titleStmt> </pre>						

	<pre> <title>The shortest TEI Document Imaginable</title> </titleStmt> <publicationStmt> <p>First published as part of TEI P2, this is the P5 version using a name space.</p> </publicationStmt> <sourceDesc> <p>No source: this is an original work.</p> </sourceDesc> </fileDesc> </teiHeader> <text> <body> <p>This is about the shortest TEI document imaginable.</p> </body> </text> </TEI> </pre>
Example	<pre> <TEI version="2.9.1" xmlns="http://www.tei-c.org/ns/1.0"> <teiHeader> <fileDesc> <titleStmt> <title>A TEI Document containing four page images </title> </titleStmt> <publicationStmt> <p>Unpublished demonstration file.</p> </publicationStmt> <sourceDesc> <p>No source: this is an original work.</p> </sourceDesc> </fileDesc> </teiHeader> <facsimile> <graphic url="page1.png"/> <graphic url="page2.png"/> <graphic url="page3.png"/> <graphic url="page4.png"/> </facsimile> </TEI> </pre>
Schematron	<s:ns prefix="tei" uri="http://www.tei-c.org/ns/1.0"/> <s:ns prefix="xs" uri="http://www.w3.org/2001/XMLSchema"/>
Schematron	<s:ns prefix="rng" uri="http://relaxng.org/ns/structure/1.0"/>
Content model	<pre> <content> <sequence> <elementRef key="teiHeader"/> <classRef key="model.resourceLike" minOccurs="1" maxOccurs="unbounded"/> </sequence> </content> </pre>
Schema Declaration	<pre> element TEI { tei_att.global.attributes, tei_att.typed.attributes, attribute version { text }?, (tei_teHeader, tei_model.resourceLike+) } </pre>

6.1.2. <ab>

<**ab**> (anonymous block) contains any arbitrary component-level unit of text, acting as an anonymous container for phrase or inter level elements analogous to, but without the semantic baggage of, a paragraph. [16.3. Blocks, Segments, and Anchors]

Module	linking
Attributes	Attributes <u>att.global</u> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<u>att.global.rendition</u> (@rend, @style, @rendition)) (<u>att.global.linking</u> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<u>att.global.analytic</u> (@ana)) (<u>att.global.facs</u> (@facs)) (<u>att.global.change</u> (@change)) (<u>att.global.responsibility</u> (@cert, @resp)) (<u>att.global.source</u> (@source)) <u>att.typed</u> (@type, @subtype) <u>att.declaring</u> (@decls) <u>att.fragmentable</u> (@part) <u>att.written</u> (@hand)
Member of	<u>model.pLike</u>
Contained by	core: <u>item</u> <u>note</u> <u>q</u> <u>quote</u> <u>sp</u> <u>stage</u> drama: <u>castList</u> figures: <u>cell</u> <u>figure</u>

	<p>header: abstract availability calendar change correction correspAction correspContext correspDesc editionStmt editorialDecl encodingDesc handNote hyphenation interpretation langUsage licence normalization prefixDef projectDesc publicationStmt punctuation quotation refsDecl segmentation seriesStmt sourceDesc stdVals</p> <p>msdescription: accMat acquisition additions binding bindingDesc collation condition decoDesc decoNote foliation handDesc history layout layoutDesc msContents msDesc msItem msItemStruct objectDesc origin physDesc provenance seal sealDesc source summary support supportDesc</p> <p>namesdates: climate event langKnowledge listRelation nym object occupation org person personGrp persona place population state terrain trait</p> <p>textstructure: argument back body div epigraph front postscript</p> <p>transcr: metamark</p>

Note	If abbreviations are expanded silently, this practice should be documented in the <editorialDecl>, either with a <normalization> element or a <p>.
Example	<pre><choice> <expan>North Atlantic Treaty Organization</expan> <abbr cert="low">NorATO</abbr> <abbr cert="high">NATO</abbr> <abbr cert="high" xml:lang="fr">OTAN</abbr> </choice></pre>
Example	<pre><choice> <abbr>SPQR</abbr> <expan>senatus populusque romanorum</expan> </choice></pre>
Content model	<pre><content> <macroRef key="macro.phraseSeq"/> </content></pre>
Schema Declaration	<pre>element abbr { tei_att.global.attributes, tei_att.typed.attribute.subtype, attribute type { text }?, tei_macro.phraseSeq }</pre>

6.1.4. <abstract>

<abstract> contains a summary or formal abstract prefixed to an existing source document by the encoder. [2.4.4. Abstracts]	
Module	header
Attributes	Attributes <u>att.global</u> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<u>att.global.rendition</u> (@rend, @style, @rendition)) (<u>att.global.linking</u> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<u>att.global.analytic</u> (@ana)) (<u>att.global.facs</u> (@facs)) (<u>att.global.change</u> (@change)) (<u>att.global.responsibility</u> (@cert, @resp)) (<u>att.global.source</u> (@source))
Member of	<u>model.profileDescPart</u>
Contained by	header: <u>profileDesc</u>
May contain	core: <u>list p</u> figures: <u>table</u> linking: <u>ab</u> namesdates: <u>listEvent listNm listObject listOrg listPerson listPlace listRelation</u>
Note	This element is intended only for cases where no abstract is available in the original source. Any abstract already present in the source document should be encoded as a <u><div></u> within the <u><front></u> , as it should for a born-digital document.
Example	<pre><profileDesc> <abstract resp="#LB"> <p>Good database design involves the acquisition and deployment of skills which have a wider relevance to the educational process. From a set of more or less instinctive rules of thumb a formal discipline or "methodology" of database design has evolved. Applying that methodology can be of great benefit to a very wide range of academic subjects: it requires fundamental skills of abstraction and generalisation and it provides a simple mechanism whereby complex ideas and information structures can be represented and manipulated, even without the use of a computer. </p> </abstract> </profileDesc></pre>
Content model	<pre><content> <alternate minOccurs="1" maxOccurs="unbounded"> <classRef key="model.pLike"/> <classRef key="model.listLike"/> </alternate> </content></pre>
Schema Declaration	<pre>element abstract { tei_att.global.attributes, (tei_model.pLike tei_model.listLike)+ }</pre>

6.1.5. <accMat>

<accMat> (accompanying material) contains details of any significant additional material which may be closely associated with the manuscript or object being described, such as non-contemporaneous documents or fragments bound in with it at some earlier historical period. [10.7.3.3. Accompanying Material]	
Module	<u>msdescription</u>
Attributes	Attributes <u>att.global</u> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<u>att.global.rendition</u> (@rend, @style, @rendition)) (<u>att.global.linking</u> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<u>att.global.analytic</u> (@ana)) (<u>att.global.facs</u> (@facs)) (<u>att.global.change</u> (@change)) (<u>att.global.responsibility</u> (@cert, @resp)) (<u>att.global.source</u> (@source)) <u>att.typed</u> (@type, @subtype)

Note	This element should be used for postal addresses only. Within it, the generic element <addrLine> may be used as an alternative to any of the more specialized elements available from the model.addrPart class, such as <street> , <postCode> etc.
Example	Using just the elements defined by the core module, an address could be represented as follows: <pre><address> <street>via Marsala 24</street> <postCode>40126</postCode> <name>Bologna</name> <name>Italy</name> </address></pre>
Example	When a schema includes the names and dates module more specific elements such as country or settlement would be preferable over generic <name> : <pre><address> <street>via Marsala 24</street> <postCode>40126</postCode> <settlement>Bologna</settlement> <country>Italy</country> </address></pre>
Example	<pre><address> <addrLine>Computing Center, MC 135</addrLine> <addrLine>P.O. Box 6998</addrLine> <addrLine>Chicago, IL 60680</addrLine></pre>

	<pre><addrLine>USA</addrLine> </address></pre>
Example	<pre><address> <country key="FR" /> <settlement type="city">Lyon</settlement> <postCode>69002</postCode> <district type="arrondissement">IIème</district> <district type="quartier">Perrache</district> <street> <num>30</num>, Cours de Verdun</street> </address></pre>
Content model	<pre><content> <sequence> <classRef key="model.global" minOccurs="0" maxOccurs="unbounded" /> <sequence minOccurs="1" maxOccurs="unbounded"> <classRef key="model.addrPart" /> <classRef key="model.global" minOccurs="0" maxOccurs="unbounded" /> </sequence> </sequence> </content></pre>

Note	When a single page is being cited, use the <i>from</i> and <i>to</i> attributes with an identical value. When no clear endpoint is provided, the <i>from</i> attribute may be used without <i>to</i> ; for example a citation such as 'p. 3ff' might be encoded <biblScope from="3">p. 3ff</biblScope>. It is now considered good practice to supply this element as a sibling (rather than a child of <imprint>, since it supplies information which does not constitute part of the imprint.
Example	<pre> <biblScope>pp 12-34</biblScope> <biblScope unit="page" from="12" to="34"/> <biblScope unit="volume">II</biblScope> </pre>

	<pre><biblScope unit="page">12</biblScope></pre>

May contain	Empty element
Note	On this element, the global <i>n</i> attribute indicates the number or other value associated with the column which follows the point of insertion of this <code><cb></code> element. Encoders should adopt a clear and consistent policy as to whether the numbers associated with column breaks relate to the physical sequence number of the column in the whole text, or whether columns are numbered within the page. The <code><cb></code> element is placed at the head of the column to which it refers.
Example	Markup of an early English dictionary printed in two columns: <pre><pb/> <cb n="1"/> <entryFree> <form>Well</form>, <sense>a Pit to hold Spring-Water</sense>; <sense>In the Art of <hi rend="italic">War</hi>, a Depth the Miner sinks into the Ground, to find out and disappoint the Enemies Mines, or to prepare one</sense>. </entryFree> <entryFree>To <form>Welter</form>, <sense>to wallow</sense>, or <sense>lie groveling</sense>.<!-- entryFree --> <!-- remainder of column --> <cb n="2"/> <entryFree> <form>Wey</form>, <sense>the greatest Measure for dry Things, containing five Chaldron</sense>. </entryFree> <entryFree> <form>Whale</form>, <sense>the greatest of Sea-Fishes</sense>. </entryFree></pre>
Content model	<pre><content> <empty/> </content></pre>
Schema Declaration	<pre>element cb { tei_att.global.attributes, tei_att.typed.attributes, tei_att.edition.attributes, tei_att.spanning.attributes, tei_att.breaking.attributes, empty }</pre>

Note	<p>Because the children of a <u><choice></u> element all represent alternative ways of encoding the same sequence, it is natural to think of them as mutually exclusive. However, there may be cases where a full representation of a text requires the alternative encodings to be considered as parallel.</p> <p>Note also that <u><choice></u> elements may self-nest.</p> <p>Where the purpose of an encoding is to record multiple witnesses of a single work, rather than to identify multiple possible encoding decisions at a given point, the <u><app></u> element and associated elements discussed in section 12.1. The Apparatus Entry, Readings, and Witnesses should be preferred.</p>
Example	<p>An American encoding of <i>Gulliver's Travels</i> which retains the British spelling but also provides a version regularized to American spelling might be encoded as follows.</p> <pre><p>Lastly, That, upon his solemn oath to observe all the above articles, the said man-mountain shall have a daily allowance of meat and drink sufficient for the support of <choice> <sic>1724</sic> <corr>1728</corr> </choice> of our subjects, with free access to our royal person, and other marks of our <choice> <orig>favour</orig> <reg>favor</reg> </choice>.</p></pre>
Content model	<pre><content> <alternate minOccurs="2" maxOccurs="unbounded"> <classRef key="model.choicePart"/> <elementRef key="choice"/> </alternate> </content></pre>
Schema Declaration	<pre>element choice { tei_att.global.attributes, (tei_model.choicePart tei_choice)+ }</pre>

Contained by	msdescription: binding bindingDesc sealDesc supportDesc
May contain	analysis: pc core: abbr add address bibl biblStruct binaryObject cb choice cit corr date del desc distinct emph expan foreign gap gb graphic hi index l label lb lg list listBibl measure measureGrp media mentioned milestone name note num orig p pb ptr q quote ref reg rs sic soCalled sp stage term time title unclear unit drama: castList figures: figure table gaiji: g header: biblFull idno linking: ab anchor link linkGrp seg msdescription: catchwords dimensions height material msDesc objectType origDate origPlace stamp watermark width namesdates: addName affiliation bloc climate country district forename genName geo geogFeat geogName listEvent listNym listObject listOrg listPerson listPlace listRelation location nameLink objectName offset orgName persName placeName population region roleName settlement state surname terrain trait spoken: kinesic vocal textstructure: floatingText transcr: addSpan delSpan fw handShift listTranspose metamark space subst supplied character data
Example	<pre> <condition> <p>There are lacunae in three places in this manuscript. After 14v two leaves has been cut out and narrow strips leaves remains in the spine. After 68v one gathering is missing and after 101v at least one gathering of 8 leaves has been lost. </p> <p>Several leaves are damaged with tears or holes or have a irregular shape. Some of the damages do not allow the lines to be of full length and they are apparently older than the script. There are tears on fol. 2r-v, 9r-v, 10r-v, 15r-18v, 19r-v, 20r-22v, 23r-v, 24r-28v, 30r-v, 32r-35v, 37r-v, 38r-v, 40r-43v, 45r-47v, 49r-v, 51r-v, 53r-60v, 67r-v, 68r-v, 70r-v, 74r-80v, 82r-v, 86r-v, 88r-v, 89r-v, 95r-v, 97r-98v 99r-v, 100r-v. On fol. 98 the corner has been torn off. Several leaves are in a bad condition due to moist and wear, and have become dark, bleached or wrinkled. </p> <p>The script has been touched up in the 17th century with black ink. The touching up on the following fols. was done by <name>Bishop Brynjólf Sveinsson</name>: 1v, 3r, 4r, 5r, 6v, 8v, 9r, 10r, 14r, 14v, 22r, 30v, 36r-52v, 72v, 77r, 78r, 103r, 104r,. An AM-note says according to the lawman <name>Sigurður Björnsson</name> that the rest of the touching up was done by himself and another lawman <name>Sigurður Jónsson</name>. <name>Sigurður Björnsson</name> did the touching up on the following fols.: 46v, 47r, 48r, 49r-v, 50r, 52r-v. <name>Sigurður Jónsson</name> did the rest of the touching up in the section 36r-59r containing <title>Bretasögr</title> </p> </condition> </pre>
Content model	<pre> <content> <macroRef key="macro.specialPara"/> </content> </pre>
Schema Declaration	<pre> element condition { tei_att.global.attributes, tei_macro.specialPara } </pre>

6.1.52. *<corr>*

<corr> (correction) contains the correct form of a passage apparently erroneous in the copy text. [3.4.1. Apparent Errors]	
Module	core
Attributes	Attributes <u>att.global</u> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<u>att.global.rendition</u> (@rend, @style, @rendition)) (<u>att.global.linking</u> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<u>att.global.analytic</u> (@ana)) (<u>att.global.facs</u> (@facs)) (<u>att.global.change</u> (@change)) (<u>att.global.responsibility</u> (@cert, @resp)) (<u>att.global.source</u> (@source)) <u>att.editLike</u> (@evidence, @instant) <u>att.typed</u> (@type, @subtype)

Note	<p>This element should be used for deletion of shorter sequences of text, typically single words or phrases. The <code><delSpan></code> element should be used for longer sequences of text, for those containing structural subdivisions, and for those containing overlapping additions and deletions.</p> <p>The text deleted must be at least partially legible in order for the encoder to be able to transcribe it (unless it is restored in a <code><supplied></code> tag). Illegible or lost text within a deletion may be marked using the <code><gap></code> tag to signal that text is present but has not been transcribed, or is no longer visible. Attributes on the <code><gap></code> element may be used to indicate how much text is omitted, the reason for omitting it, etc. If text is not fully legible, the <code><unclear></code> element (available when using the additional tagset for transcription of primary sources) should be used to signal the areas of text which cannot be read with confidence in a similar way.</p> <p>Degrees of uncertainty over what can still be read, or whether a deletion was intended may be indicated by use of the <code><certainty></code> element (see 21. Certainty, Precision, and Responsibility).</p> <p>There is a clear distinction in the TEI between <code></code> and <code><surplus></code> on the one hand and <code><gap></code> or <code><unclear></code> on the other. <code></code> indicates a deletion present in the source being transcribed, which states the author's or a later scribe's intent to cancel or remove text. <code><surplus></code> indicates material present in the source being transcribed which should have been so deleted, but which is not in fact. <code><gap></code> or <code><unclear></code>, by contrast, signal an editor's or encoder's decision to omit something or their inability to read the source text. See sections 11.3.1.7. Text Omitted from or Supplied in the Transcription and 11.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination for the relationship between these and other related elements used in detailed transcription.</p>
Example	<pre><1> <del rend="overtyped">Mein Frisch <del rend="overstrike" type="primary">schwebt weht der Wind </1></pre>
Example	<pre><del rend="overstrike"> <gap reason="illegible" quantity="5" unit="character"/> </pre>

```

6.1.65. <delSpan>

<**delSpan**> (deleted span of text) marks the beginning of a longer sequence of text deleted, marked as deleted, or otherwise signaled as superfluous or spurious by an author, scribe, annotator, or corrector. [11.3.1.4. Additions and Deletions]

Module	transcr
Attributes	Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.transcriptional (@status, @cause, @seq) (att.editLike (@evidence, @instant)) (att.written (@hand)) att.typed (@type, @subtype) att.spanning (@spanTo) att.dimensions (@unit, @quantity, @extent, @precision, @scope) (att.ranging (@atLeast, @atMost, @min, @max, @confidence))

May contain	Empty element
Note	<p>Both the beginning and ending of the deleted sequence must be marked: the beginning by the <delSpan> element, the ending by the target of the <i>spanTo</i> attribute.</p> <p>The text deleted must be at least partially legible, in order for the encoder to be able to transcribe it. If it is not legible at all, the <delSpan> tag should not be used. Rather, the <gap> tag should be employed to signal that text cannot be transcribed, with the value of the <i>reason</i> attribute giving the cause for the omission from the transcription as deletion. If it is not fully legible, the <unclear> element should be used to signal the areas of text which cannot be read with confidence. See further sections 11.3.1.7. Text Omitted from or Supplied in the Transcription and, for the close association of the <delSpan> tag with the <gap>, <damage>, <unclear> and <supplied> elements, 11.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination.</p> <p>The <delSpan> tag should not be used for deletions made by editors or encoders. In these cases, either the <corr> tag or the <gap> tag should be used.</p>
Example	<pre> <p>Paragraph partially deleted. This is the undeleted portion <delSpan spanTo="#a23"/>and this the deleted portion of the paragraph.</p> <p>Paragraph deleted together with adjacent material.</p> <p>Second fully deleted paragraph.</p> <p>Paragraph partially deleted; in the middle of this paragraph the deletion ends and the anchor point marks the resumption <anchor xml:id="a23"/> of the text. ...</p> </pre>

6.1.72. <divGen>

<divGen> (automatically generated text division) indicates the location at which a textual division generated automatically by a text-processing application is to appear. [3.8.2. Index Entries]

Module	core
Attributes	<p>Attributes <u>att_global</u> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<u>att.global.rendition</u> (@rend, @style, @rendition)) (<u>att.global.linking</u> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<u>att.global.analytic</u> (@ana)) (<u>att.global.facs</u> (@facs)) (<u>att.global.change</u> (@change)) (<u>att.global.responsibility</u> (@cert, @resp)) (<u>att.global.source</u> (@source))</p> <p>type specifies what type of generated text division (e.g. index, table of contents, etc.) is to appear.</p> <p>Status Optional</p> <p>Datatype <u>teidata.enumerated</u></p> <p>Sample values include: index an index is to be generated and inserted at this point. toc a table of contents figlist a list of figures tablist a list of tables</p> <p>Note Valid values are application-dependent; those shown are of obvious utility in document production, but are by no means exhaustive.</p>
Member of	<u>model.divGenLike</u> <u>model.frontPart</u>
Contained by	textstructure: <u>back</u> <u>body</u> <u>div</u> <u>front</u>
May contain	core: <u>head</u>
Note	This element is intended primarily for use in document production or manipulation, rather than in the transcription of pre-existing materials; it makes it easier to specify the location of indices, tables of contents, etc., to be generated by text preparation or word processing software.
Example	One use for this element is to allow document preparation software to generate an index and insert it in the appropriate place in the output. The example below assumes that the <i>index</i>

	<p>Name attribute on <index> elements in the text has been used to specify index entries for the two generated indexes, named NAMES and THINGS:</p> <pre><back> <div1 type="backmat"> <head>Bibliography</head> <!-- ... --> </div1> <div1 type="backmat"> <head>Indices</head> <divGen n="Index Nominum" type="NAMES"/> <divGen n="Index Rerum" type="THINGS"/> </div1> </back></pre>
Example	Another use for <divGen> is to specify the location of an automatically produced table of contents:
Content model	<pre><front> <!--<titlePage>...</titlePage>--> <divGen type="toc"/> <div> <head>Preface</head> <p> ... </p> </div> </front></pre>
Schema Declaration	<pre>element divGen { tei_att.global.attributes, attribute type { text }?, tei_model.headLike* }</pre>

6.1.73. <docDate>

<docDate> (document date) contains the date of a document, as given on a title page or in a dateline. [4.6. Title Pages]

Module	textstructure						
Attributes	<p>Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))</p> <p>when gives the value of the date in standard form, i.e. YYYY-MM-DD.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.temporal.w3c</td> </tr> <tr> <td>Note</td> <td>For simple dates, the <i>when</i> attribute should give the Gregorian or proleptic Gregorian date in one of the formats specified in <i>XML Schema Part 2: Datatypes Second Edition</i>.</td> </tr> </table>	Status	Optional	Datatype	teidata.temporal.w3c	Note	For simple dates, the <i>when</i> attribute should give the Gregorian or proleptic Gregorian date in one of the formats specified in <i>XML Schema Part 2: Datatypes Second Edition</i> .
Status	Optional						
Datatype	teidata.temporal.w3c						
Note	For simple dates, the <i>when</i> attribute should give the Gregorian or proleptic Gregorian date in one of the formats specified in <i>XML Schema Part 2: Datatypes Second Edition</i> .						
Member of	model.divWrapper model.pLike.front model.titlepagePart						
Contained by	core: lg list drama: castList figures: figure table msdescription: msItem textstructure: back body dateline div front						
May contain	analysis: pc core: abbr add address binaryObject cb choice cit corr date del distinct emph expan foreign gap gb graphic hi index lb measure measureGrp media mentioned milestone name note num orig pb ptr q quote ref reg rs sic soCalled term time title unclear unit figures: figure gaiji: g header: idno

Note	Cf. the general <code><date></code> element in the core tag set. This specialized element is provided for convenience in marking and processing the date of the documents, since it is likely to require specialized handling for many applications. It should be used only for the date of the entire document, not for any subset or part of it.
Example	<pre><docImprint>Oxford, Clarendon Press, <docDate>1987</docDate> </docImprint></pre>
Content model	<pre><content> <macroRef key="macro.phraseSeq"/> </content></pre>

6.1.90. <fileDesc>

<fileDesc> (file description) contains a full bibliographic description of an electronic file. [2.2. The File Description 2.1.1. The TEI Header and Its Components]

Module	header
--------	--------

Attributes	Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))
Contained by	header: biblFull teiHeader
May contain	header: editionStmt extent notesStmt publicationStmt seriesStmt sourceDesc titleStmt
Note	The major source of information for those seeking to create a catalogue entry or bibliographic citation for an electronic file. As such, it provides a title and statements of responsibility together with details of the publication or distribution of the file, of any series to which it belongs, and detailed bibliographic notes for matters not addressed elsewhere in the header. It also contains a full bibliographic description for the source or sources from which the electronic text was derived.
Example	<pre><fileDesc> <titleStmt> <title>The shortest possible TEI document</title> </titleStmt> <publicationStmt> <p>distributed as part of TEI P5</p> </publicationStmt> <sourceDesc> <p>No print source exists: this is an original digital text</p> </sourceDesc> </fileDesc></pre>
Content model	<pre><content> <sequence> <sequence> <elementRef key="titleStmt" /> <elementRef key="editionStmt" minOccurs="0" /> <elementRef key="extent" minOccurs="0" /> <elementRef key="publicationStmt" /> <elementRef key="seriesStmt" minOccurs="0" /> <elementRef key="notesStmt" minOccurs="0" /> </sequence> <elementRef key="sourceDesc" minOccurs="1" maxOccurs="unbounded" /> </sequence> </content></pre>
Schema Declaration	<pre>element fileDesc { tei_att.global.attributes, ((tei_titleStmt, tei_editionStmt?, tei_extent?, tei_publicationStmt, tei_seriesStmt?, tei_notesStmt?), tei_sourceDesc+) }</pre>

6.1.91. <floatingText>

<floatingText> contains a single text of any kind, whether unitary or composite, which interrupts the text containing it at any point and after which the surrounding text resumes. [4.3.2. Floating Texts]

Module	textstructure
Attributes	Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.declaring (@decls) att.typed (@type, @subtype)

Note	Because cultural conventions differ as to which elements are grouped as front matter and which as back matter, the content models for the <code><front></code> and <code><back></code> elements are identical.
Example	<pre> <front> <epigraph> <quote>Nam Sibyllam quidem Cumis ego ipse oculis meis vidi in ampulla pendere, et cum illi pueri dicerent: <q xml:lang="gr">##### ## #####</q>; respondebat illa: <q xml:lang="gr">##### ####.</q> </quote> </epigraph> <div type="dedication"> <p>For Ezra Pound <q xml:lang="it">il miglior fabbro.</q> </p> </div> </front> </pre>
Example	<pre> <front> <div type="dedication"> <p>To our three selves</p> </div> <div type="preface"> <head>Author's Note</head> <p>All the characters in this book are purely imaginary, and if the author has used names that may suggest a reference to living persons she has done so inadvertently.</p> </div> </front> </pre>
Example	<pre> <front> <div type="abstract"> <div> <head> BACKGROUND:</head> <p>Food insecurity can put children at greater risk of obesity because of altered food choices and nonuniform consumption patterns.</p> </div> <div> <head> OBJECTIVE:</head> <p>We examined the association between obesity and both child-level food insecurity and personal food insecurity in US children.</p> </div> <div> <head> DESIGN:</head> <p>Data from 9,701 participants in the National Health and Nutrition Examination Survey, 2001-2010, aged 2 to 11 years were analyzed. Child-level food insecurity was assessed with the US Department of Agriculture's Food Security Survey Module based on eight child-specific questions. Personal food insecurity was assessed with five additional questions. Obesity was defined, using physical measurements, as body mass index (calculated as kg/m²) greater than or equal to the age- and sex-specific 95th percentile of the Centers for Disease Control and Prevention growth charts. Logistic regressions adjusted for sex, race/ethnic group, poverty level, and survey year were conducted to describe associations between obesity and food insecurity.</p> </div> <div> <head> RESULTS:</head> <p>Obesity was significantly associated with personal food insecurity for children aged 6 to 11 years (odds ratio=1.81; 95% CI 1.33 to 2.48), but not in children aged 2 to 5 years (odds ratio=0.88; 95% CI 0.51 to 1.51). Child-level food insecurity was not associated with obesity among 2- to 5-year-olds or 6- to 11-year-olds.</p> </div> <div> <head> CONCLUSIONS:</head> <p>Personal food insecurity is associated with an increased risk of obesity only in children aged 6 to 11 years. Personal food-insecurity measures may give different results than aggregate food-insecurity measures in children.</p> </div> </div> </front> </pre>

May contain	Character data only
Note	Uses of <code><geo></code> can be associated with a coordinate system, defined by a <code><geoDecl></code> element supplied in the TEI header, using the <code>decls</code> attribute. If no such link is made, the assumption is that the content of each <code><geo></code> element will be a pair of numbers separated by whitespace, to be interpreted as latitude followed by longitude according to the World Geodetic System.
Example	<pre><geoDecl xml:id="WGS" datum="WGS84">World Geodetic System</geoDecl> <geoDecl xml:id="OS" datum="OSGB36">Ordnance Survey</geoDecl> <!-- ... --> <location> <desc>A tombstone plus six lines of Anglo-Saxon text, built into the west tower (on the south side of the archway, at 8 ft. above the ground) of the Church of St. Mary-le-Wigford in Lincoln.</desc> <geo decls="#WGS">53.226658 -0.541254</geo> <geo decls="#OS">SK 97481 70947</geo> </location></pre>
Example	<code><geo>41.687142 -74.870109</geo></code>
Content model	<pre><content> <textNode/> </content></pre>
Schema Declaration	<code>element geo { tei_att.global.attributes, tei_att.declaring.attributes, text }</code>

6.1.104. `<geoDecl>`

`<geoDecl>` (geographic coordinates declaration) documents the notation and the datum used for geographic coordinates expressed as content of the `<geo>` element elsewhere within the document. [2.3.8. The Geographic Coordinates Declaration]

Module	header
Attributes	<p>Attributes <code>att.global</code> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<code>att.global.rendition</code> (@rend, @style, @rendition)) (<code>att.global.linking</code> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<code>att.global.analytic</code> (@ana)) (<code>att.global.facs</code> (@facs)) (<code>att.global.change</code> (@change)) (<code>att.global.responsibility</code> (@cert, @resp)) (<code>att.global.source</code> (@source)) <code>att.declarable</code> (@default)</p> <p>datum supplies a commonly used code name for the datum employed.</p> <p>Status Optional</p> <p>Datatype <code>teidata.enumerated</code></p> <p>Suggested WGS84</p> <p>values include: (World Geodetic System) a pair of numbers to be interpreted as latitude followed by longitude according to the World Geodetic System.[Default]</p> <p>MGRS (Military Grid Reference System) the values supplied are geospatial entity object codes, based on</p> <p>OSGB36</p>

	<p>(ordnance survey great britain) the value supplied is to be interpreted as a British National Grid Reference.</p> <p>ED50 (European Datum coordinate system) the value supplied is to be interpreted as latitude followed by longitude according to the European Datum coordinate system.</p>

Note	The <handShift> element may be used either to denote a shift in the document hand (as from one scribe to another, or one writing style to another). Or, it may indicate a shift within a document hand, as a change of writing style, character or ink. Like other milestone elements, it should appear at the point of transition from some other state to the state which it describes.						
Example	<pre><l>When wolde the cat dwelle in his ynne</l> <handShift medium="greenish-ink"/> <l>And if the cattes skynne be slyk <handShift medium="black-ink"/> and gaye</l></pre>						
Content model	<pre><content> <empty/> </content></pre>						
Schema Declaration	<pre>element handShift { tei_att.global.attributes, tei_att.handFeatures.attributes, attribute new { text }?, empty }</pre>						

6.1.112. `<head>`

Note	The <code><head></code> element is used for headings at all levels; software which treats (e.g.) chapter headings, section headings, and list titles differently must determine the proper processing of a <code><head></code> element based on its structural position. A <code><head></code> occurring as the first element of a list is the title of that list; one occurring as the first element of a <code><div1></code> is the title of that chapter or section.
Example	<p>The most common use for the <code><head></code> element is to mark the headings of sections. In older writings, the headings or <i>incipits</i> may be rather longer than usual in modern works. If a section has an explicit ending as well as a heading, it should be marked as a <code><trailer></code>, as in this example:</p> <pre> <div1 n="I" type="book"> <head>In the name of Christ here begins the first book of the ecclesiastical history of Georgius Florentinus, known as Gregory, Bishop of Tours.</head> <div2 type="section"> <head>In the name of Christ here begins Book I of the history.</head> <p>Proposing as I do ...</p> <p>From the Passion of our Lord until the death of Saint Martin four hundred and twelve years passed.</p> <trailer>Here ends the first Book, which covers five thousand, five hundred and ninety-six years from the beginning of the world down to the death of Saint Martin.</trailer> </div2> </div1> </pre>

Example	When headings are not inline with the running text (see e.g. the heading "Secunda conclusio") they might however be encoded as if. The actual placement in the source document can be captured with the <i>place</i> attribute.
	<pre><div type="subsection"> <head place="margin">Secunda conclusio</head> <p> <lb n="1251"/> <hi rend="large">Potencia: habitus: et actus: recipiunt speciem ab obiectis<supplied>.</supplied> </hi> <lb n="1252"/>Probatur sic. Omne importans necessarium habitudinem ad proprium [...] </p> </div></pre>
Example	The <code><head></code> element is also used to mark headings of other units, such as lists:
	<pre>With a few exceptions, connectives are equally useful in all kinds of discourse: description, narration, exposition, argument. <list rend="bulleted"> <head>Connectives</head> <item>above</item> <item>accordingly</item> <item>across from</item> <item>adjacent to</item> <item>again</item> <item> <!-- ... --> </item> </list></pre>

6.1.122. *<item>*

<item> contains one component of a list. [3.7. Lists 2.6. The Revision Description]

Module	core
Attributes	Attributes <u>att.global</u> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<u>att.global.rendition</u> (@rend, @style, @rendition)) (<u>att.global.linking</u> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<u>att.global.analytic</u> (@ana)) (<u>att.global.facs</u> (@facs)) (<u>att.global.change</u> (@change)) (<u>att.global.responsibility</u> (@cert, @resp)) (<u>att.global.source</u> (@source)) <u>att.sortable</u> (@sortKey)
Contained by	core: <u>list</u>
May contain	analysis: <u>pc</u> core: <u>abbr add address bibl biblStruct binaryObject cb choice cit corr date del desc distinct emph expand foreign gap gb graphic hi index l label lb lg list listBibl measure measureGrp media mentioned milestone name note num orig p pb ptr q quote ref reg rs sic soCalled stage term time title unclear unit</u> drama: <u>castList</u>

	<p>figures: figure table</p> <p>gaiji: g</p> <p>header: biblFull idno</p> <p>linking: ab anchor link linkGrp seg</p> <p>msdescription: catchwords dimensions height material msDesc objectType origDate origPlace stamp watermark width</p> <p>namesdates: addName affiliation bloc climate country district forename genName geo geoFeat geogName listEvent listNym listObject listOrg listPerson listPlace listRelation location nameLink objectName offset orgName persName placeName population region roleName settlement state surname terrain trait</p> <p>spoken: kinesic vocal</p> <p>textstructure: floatingText</p> <p>transcr: addSpan delSpan fw handShift listTranspose metamark space subst supplied character data</p>
Note	<p>May contain simple prose or a sequence of chunks.</p> <p>Whatever string of characters is used to label a list item in the copy text may be used as the value of the global <i>n</i> attribute, but it is not required that numbering be recorded explicitly. In ordered lists, the <i>n</i> attribute on the <i><item></i> element is by definition synonymous with the use of the <i><label></i> element to record the enumerator of the list item. In glossary lists, however, the term being defined should be given with the <i><label></i> element, not <i>n</i>.</p>
Example	<pre><list rend="numbered"> <head>Here begin the chapter headings of Book IV</head> <item n="4.1">The death of Queen Clotild.</item> <item n="4.2">How King Lothar wanted to appropriate one third of the Church revenues.</item> <item n="4.3">The wives and children of Lothar.</item> <item n="4.4">The Counts of the Bretons.</item> <item n="4.5">Saint Gall the Bishop.</item> <item n="4.6">The priest Cato.</item> <item> ...</item> </list></pre>
Content model	<pre><content> <macroRef key="macro.specialPara"/> </content></pre>
Schema Declaration	<pre>element item { tei_att.global.attributes, tei_att.sortable.attributes, tei_macro.specialPara }</pre>

6.1.123. <keywords>

<keywords> contains a list of keywords or phrases identifying the topic or nature of a text. [2.4.3. The Text Classification]					
Module	header				
Attributes	<p>Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linkning (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))</p> <p>scheme identifies the controlled vocabulary within which the set of keywords concerned is defined, for example by a <i><taxonomy></i> element, or by some other resource.</p> <table style="margin-left: 20px;"> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.pointer</td> </tr> </table>	Status	Optional	Datatype	teidata.pointer
Status	Optional				
Datatype	teidata.pointer				
Contained by	header: textClass				
May contain	core: list term				
Note	<p>Each individual keyword (including compound subject headings) should be supplied as a <i><term></i> element directly within the <i><keywords></i> element. An alternative usage, in which each <i><term></i> appears within a <i><item></i> inside a <i><list></i> is permitted for backwards compatibility, but is deprecated.</p> <p>If no control list exists for the keywords used, then no value should be supplied for the <i>scheme</i> attribute.</p>				

Example	<pre><keywords scheme="http://classificationweb.net"> <term>Babbage, Charles</term> <term>Mathematicians - Great Britain - Biography</term> </keywords></pre>
Example	<pre><keywords> <term>Fermented beverages</term> <term>Central Andes</term> <term>Schinus molle</term> <term>Molle beer</term> <term>Indigenous peoples</term> <term>Ethnography</term> <term>Archaeology</term> </keywords></pre>

Example	<p>Labels are commonly used for the headwords in glossary lists; note the use of the global <i>xml:lang</i> attribute to set the default language of the glossary list to Middle English, and identify the glosses and headings as modern English or Latin:</p> <pre><list type="gloss" xml:lang="enm"> <head xml:lang="en">Vocabulary</head> <headLabel xml:lang="en">Middle English</headLabel> <headItem xml:lang="en">New English</headItem> <label>nu</label> <item xml:lang="en">now</item> <label>lhude</label> <item xml:lang="en">loudly</item> <label>bloweth</label> <item xml:lang="en">blooms</item> <label>med</label> <item xml:lang="en">meadow</item> <label>wude</label> <item xml:lang="en">wood</item> <label>awē</label> <item xml:lang="en">ewe</item> <label>louth</label> <item xml:lang="en">lows</item> <label>sterteth</label> <item xml:lang="en">bounds, frisks (cf. <cit> <ref>Chaucer, K.T. 644</ref> <quote>a courser, <term>sterting</term>as the fyre</quote> </cit> </item> <label>verteth</label> <item xml:lang="la">pedit</item> <label>murie</label> <item xml:lang="en">merrily</item> <label>swik</label> <item xml:lang="en">cease</item> <label>naver</label> <item xml:lang="en">never</item> </list></pre>
Example	<p>Labels may also be used to record explicitly the numbers or letters which mark list items in ordered lists, as in this extract from Gibbon's <i>Autobiography</i>. In this usage the <i><label></i> element is synonymous with the <i>n</i> attribute on the <i><item></i> element:</p> <pre>I will add two facts, which have seldom occurred in the composition of six, or at least of five quartos. <list rend="runon" type="ordered"> <label>(1)</label> <item>My first rough manuscript, without any intermediate copy, has been sent to the press.</item> <label>(2) </label> <item>Not a sheet has been seen by any human eyes, excepting those of the author and the printer: the faults and the merits are exclusively my own.</item> </list></pre>
Example	<p>Labels may also be used for other structured list items, as in this extract from the journal of Edward Gibbon:</p> <pre><list type="gloss"> <label>March 1757.</label> <item>I wrote some critical observations upon Plautus.</item> <label>March 8th.</label> <item>I wrote a long dissertation upon some lines of Virgil.</item> <label>June.</label> <item>I saw Mademoiselle Curchod - <quote xml:lang="la">Omnia vincit amor, et nos cedamus amori.</quote> </item> <label>August.</label> <item>I went to Crassy, and staid two days.</item> </list></pre> <p>Note that the <i><label></i> might also appear within the <i><item></i> rather than as its sibling. Though syntactically valid, this usage is not recommended TEI practice.</p>
Example	<p>Labels may also be used to represent a label or heading attached to a paragraph or sequence of paragraphs not treated as a structural division, or to a group of verse lines. Note that, in this case, the <i><label></i> element appears <i>within</i> the <i><p></i> or <i><g></i> element, rather than as a preceding sibling of it.</p>

	<pre><p>[...] <lb/>&amp; n'entrer en mauvais &amp; mal-heu- <lb/>ré me#nage. Or des que le cor#ente- <lb/>ment des parties y e#t le mariage e#t <lb/> arre#té, quoy que de fait il ne #oit <label place="margin">Pui##ance maritale entre les Romains.</label> <lb/> con#ommé. Depuis la con#omma- <lb/>tion du mariage la femme e#t #oubs <lb/> la pui##ance du mary, s'il n'e#t e#cla- <lb/>ue ou enfant de famille : car en ce <lb/> cas, la femme, qui a e#pou#é vn en- <lb/>fant de famille, e#t #ous la pui##ance [...]</p></pre>
	<p>In this example the text of the label appears in the right hand margin of the original source, next to the paragraph it describes, but approximately in the middle of it. If so desired the <i>type</i> attribute may be used to distinguish different categories of label.</p>
Content model	<pre><content> <macroRef key="macro.phraseSeq"/> </content></pre>
Schema Declaration	<pre>element label { tei_att.global.attributes, tei_att.typed.attributes, tei_att.placement.attributes, tei_att.written.attributes, tei_macro.phraseSeq }</pre>

6.1.127. *<langKnowledge>*

<langKnowledge> (language knowledge) summarizes the state of a person's linguistic knowledge, either as prose or by a list of *<langKnown>* elements. [13.3.2.1. Personal Characteristics]

Module	namesdates
Attributes	<p>Attributes <u>att_global</u> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<u>att_global.rendition</u> (@rend, @style, @rendition)) (<u>att_global.linking</u> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<u>att_global.analytic</u> (@ana)) (<u>att_global.facs</u> (@facs)) (<u>att_global.change</u> (@change)) (<u>att_global.responsibility</u> (@cert, @resp)) (<u>att_global.source</u> (@source)) <u>att.datable</u> (@calendar, @period) (<u>att.datable.w3c</u> (@when, @notBefore, @notAfter, @from, @to)) (<u>att.datable.iso</u> (@when-iso, @notBefore-iso, @notAfter-iso, @from-iso, @to-iso)) (<u>att.datable.custom</u> (@when-custom, @notBefore-custom, @notAfter-custom, @from-custom, @to-custom, @datingPoint, @datingMethod)) <u>att.edit-Like</u> (@evidence, @instant) <u>att.typed</u> (type, @subtype)</p> <p>type characterizes the element in some sense, using any convenient classification scheme or typology.</p> <p>Derived from <u>att.typed</u></p> <p>Status Optional</p> <p>Datatype <u>teidata.enumerated</u></p> <p>Sample values include: lis-ten-ing speaking reading writing</p> <p>tags supplies one or more valid language tags for the languages specified</p> <p>Status Optional</p>

	<p>Datatype 1–# occurrences of <code>teidata.language</code> separated by whitespace</p> <p>Note This attribute should be supplied only if the element contains no <code><langKnown></code> children. Its values are language ‘tags’ as defined in RFC 4646 or its successor</p>

6.1.133. *<lb>*

<lb> (line beginning) marks the beginning of a new (typographic) line in some edition or version of a text. [3.10.3. Milestone Elements 7.2.5. Speech Contents]

Module	core
Attributes	Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.typed (@type, @subtype) att.edition (@ed, @edRef) att.spanning (@spanTo) att.breaking (@break)
Member of	model.milestoneLike
Contained by	core: abbr add addrLine address author bibl biblScope cit citedRange corr date del distinct editor emph expan foreign head hi imprint item l label lg list listBibl measure mentioned name note num orig p pubPlace publisher q quote ref reg resp rs series sic soCalled sp speaker stage street term textLang time title unclear unit drama: castItem castList role roleDesc figures: cell figure table header: authority change distributor edition extent funder geoDecl handNote language licence principal sponsor linking: ab seg msdescription: accMat acquisition additions catchwords collation condition decoNote explicit foliation layout material msItem objectType origDate origPlace origin provenance source stamp summary support watermark namesdates: addName affiliation age birth bloc country death district education faith floruit forename genName geogFeat geogName langKnown nameLink nationality objectName occupation offset org orgName persName person personGrp persona placeName region residence roleName settlement sex socieStatus surname textstructure: argument back body byline closer dateline div docDate epigraph floatingText front opener postscript salute signed text trailer transcr: fw metamark subst supplied surface zone
May contain	Empty element
Note	<p>By convention, <i><lb></i> elements should appear at the point in the text where a new line starts. The <i>n</i> attribute, if used, indicates the number or other value associated with the text between this point and the next <i><lb></i> element, typically the sequence number of the line within the page, or other appropriate unit. This element is intended to be used for marking actual line breaks on a manuscript or printed page, at the point where they occur; it should not be used to tag structural units such as lines of verse (for which the <i><l></i> element is available) except in circumstances where structural units cannot otherwise be marked.</p> <p>The <i>type</i> attribute may be used to characterize the line break in any respect. The more specialized attributes <i>break</i>, <i>ed</i>, or <i>edRef</i> should be preferred when the intent is to indicate whether or not the line break is word-breaking, or to note the source from which it derives.</p>
Example	<p>This example shows typographical line breaks within metrical lines, where they occur at different places in different editions:</p> <pre> <l>Of Mans First Disobedience,<lb ed="1674"/> and<lb ed="1667"/> the Fruit</l> <l>Of that Forbidden Tree, whose<lb ed="1667 1674"/> mortal tast</l> <l>Brought Death into the World,<lb ed="1667"/> and all<lb ed="1674"/> our woe,</l> </pre>

Example	This example encodes typographical line breaks as a means of preserving the visual appearance of a title page. The <i>break</i> attribute is used to show that the line break does not (as elsewhere) mark the start of a new word. <pre><titlePart> <lb/>With Additions, ne-<lb break="no"/>ver before Printed. </titlePart></pre>
Content model	<pre><content> <empty/> </content></pre>

Note	May contain an optional heading followed by a series of items, or a series of label and item pairs, the latter being optionally preceded by one or two specialized headings.
Example	<pre><list rend="numbered"> <item>a butcher</item> <item>a baker</item> <item>a candlestick maker, with <list rend="bulleted"> <item>rings on his fingers</item> <item>bells on his toes</item> </list> </item> </list></pre>

	<pre></item> </list></pre>
Example	<pre><list type="syllogism" rend="bulleted"> <item>All Cretans are liars.</item> <item>Epimenides is a Cretan.</item> <item>ERGO Epimenides is a liar.</item> </list></pre>
Example	<pre><list type="litanies" rend="simple"> <item>God save us from drought.</item> <item>God save us from pestilence.</item> <item>God save us from wickedness in high places.</item> <item>Praise be to God.</item> </list></pre>
Example	<p>The following example treats the short numbered clauses of Anglo-Saxon legal codes as lists of items. The text is from an ordinance of King Athelstan (924–939):</p> <pre><div1 type="section"> <head>Athelstan's Ordinance</head> <list rend="numbered"> <item n="1">Concerning thieves. First, that no thief is to be spared who is caught with the stolen goods, [if he is] over twelve years and [if the value of the goods is] over eightpence. <list rend="numbered"> <item n="1.1">And if anyone does spare one, he is to pay for the thief with his wergild – and the thief is to be no nearer a settlement on that account – or to clear himself by an oath of that amount.</item> <item n="1.2">If, however, he [the thief] wishes to defend himself or to escape, he is not to be spared [whether younger or older than twelve].</item> <item n="1.3">If a thief is put into prison, he is to be in prison 40 days, and he may then be redeemed with 120 shillings; and the kindred are to stand surety for him that he will desist for ever.</item> <item n="1.4">And if he steals after that, they are to pay for him with his wergild, or to bring him back there.</item> <item n="1.5">And if he steals after that, they are to pay for him with his wergild, whether to the king or to him to whom it rightly belongs; and everyone of those who supported him is to pay 120 shillings to the king as a fine.</item> </list> </item> <item n="2">Concerning lordless men. And we pronounced about these lordless men, from whom no justice can be obtained, that one should order their kindred to fetch back such a person to justice and to find him a lord in public meeting. <list rend="numbered"> <item n="2.1">And if they then will not, or cannot, produce him on that appointed day, he is then to be a fugitive afterwards, and he who encounters him is to strike him down as a thief.</item> <item n="2.2">And he who harbours him after that, is to pay for him with his wergild or to clear himself by an oath of that amount.</item> </list> </item> <item n="3">Concerning the refusal of justice. The lord who refuses justice and upholds his guilty man, so that the king is appealed to, is to repay the value of the goods and 120 shillings to the king; and he who appeals to the king before he demands justice as often as he ought, is to pay the same fine as the other would have done, if he had refused him justice. <list rend="numbered"> <item n="3.1">And the lord who is an accessory to a theft by his slave, and it becomes known about him, is to forfeit the slave and be liable to his wergild on the first occasion if he does it more often, he is to be liable to pay all that he owns.</item> <item n="3.2">And likewise any of the king's treasurers or of our reeves, who has been an accessory of thieves who have committed theft, is to liable to the same.</item> </list> </item> <item n="4">Concerning treachery to a lord. And we have pronounced concerning treachery to a lord, that he [who is accused] is to forfeit his life if he cannot deny it or is afterwards convicted at the three-fold ordeal.</item> </list> </div1></pre>
	<p>Note that nested lists have been used so the tagging mirrors the structure indicated by the two-level numbering of the clauses. The clauses could have been treated as a one-level list with irregular numbering, if desired.</p>
Example	<pre><p>These decrees, most blessed Pope Hadrian, we propounded in the public council ... and they confirmed them in our hand in your stead with the sign of the Holy Cross, and afterwards inscribed with a careful pen on the paper of this page, affixing thus the sign of the Holy Cross. <list rend="simple"> <item>I, Eanbald, by the grace of God archbishop of the holy church of York, have subscribed to the pious and catholic validity of this document with the sign of the Holy Cross.</item> <item>I, Elfwold, king of the people across the Humber, consenting have subscribed with the sign of the Holy Cross.</item> <item>I, Tilberht, prelate of the church of Hexham, rejoicing have subscribed with the sign of the Holy Cross.</item> <item>I, Highbald, bishop of the church of Lindisfarne, obeying have subscribed with the sign of the Holy Cross.</item></pre>

	<pre> <item>I, Ethelbert, bishop of Candida Casa, suppliant, have subscribed with thef sign of the Holy Cross.</item> <item>I, Ealdwulf, bishop of the church of Mayo, have subscribed with devout will.</item> <item>I, Athelwine, bishop, have subscribed through delegates.</item> <item>I, Sicga, patrician, have subscribed with serene mind with the sign of the Holy Cross.</item> </list> </p></pre>

6.1.155. <milestone>

<milestone> marks a boundary point separating any kind of section of a text, typically but not necessarily indicating a point at which some part of a standard reference system changes, where the change is not represented by a structural element.
[3.10.3. Milestone Elements]

Module	core
Attributes	Attributes <u>att.global</u> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<u>att.global.rendition</u> (@rend, @style, @rendition)) (<u>att.global.linking</u> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<u>att.global.analytic</u> (@ana)) (<u>att.global.facs</u> (@facs)) (<u>att.global.change</u> (@change)) (<u>att.global.responsibility</u> (@cert, @resp)) (<u>att.global.source</u> (@source)) <u>att.milestoneUnit</u> (@unit) <u>att.typed</u> (@type, @subtype) <u>att.edition</u> (@ed, @edRef) <u>att.spanning</u> (@spanTo) <u>att.breaking</u> (@break)
Member of	<u>model.milestoneLike</u>
Contained by	<u>core:</u> abbr add addrLine address author bibl biblScope cit citedRange corr date del distinct editor emph expan foreign head hi imprint item l label lg list listBibl measure mentioned name note num orig p pubPlace publisher q quote ref reg resp rs series sic soCalled sp speaker stage street term textLang time title unclear unit <u>drama:</u> castItem castList role roleDesc <u>figures:</u> cell figure table <u>header:</u> authority change distributor edition extent funder geoDecl handNote language licence principal sponsor <u>linking:</u> ab seg <u>msdescription:</u> accMat acquisition additions catchwords collation condition decoNote explicit foliation layout material msItem objectType origDate origPlace origin provenance source stamp summary support watermark <u>namesdates:</u> addName affiliation age birth bloc country death district education faith floruit forename genName geogFeat geogName langKnown nameLink nationality objectName occupation offset org orgName persName person personGrp persona placeName region residence roleName settlement sex socieStatus surname <u>textstructure:</u> argument back body byline closer dateline div docDate epigraph floatingText front opener postscript salute signed text trailer <u>transcr:</u> fw metamark subst supplied surface zone
May contain	Empty element
Note	<p>For this element, the global <i>n</i> attribute indicates the new number or other value for the unit which changes at this milestone. The special value <i>unnumbered</i> should be used in passages which fall outside the normal numbering scheme, such as chapter or other headings, poem numbers or titles, etc.</p> <p>The order in which <milestone> elements are given at a given point is not normally significant.</p>
Example	<pre><milestone n="23" ed="La" unit="Dreissiger"/> ... <milestone n="24" ed="AV" unit="verse"/> ...</pre>
Content model	<pre><content> <empty/> </content></pre>

Schema Declaration	<pre> element milestone { tei_att.global.attributes, tei_att.milestoneUnit.attributes, tei_att.typed.attributes, tei_att.edition.attributes, tei_att.spanning.attributes, tei_att.breaking.attributes, empty } </pre>
---------------------------	---

6.1.156. <monogr>

<monogr> (monographic level) contains bibliographic elements describing an item (e.g. a book or journal) published as an independent item (i.e. as a separate physical object). [3.11.2.1. Analytic, Monographic, and Series Levels]

Module	core
Attributes	Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))
Contained by	core: biblStruct
May contain	core: author biblScope editor imprint note ptr ref respStmt textLang title header: authority availability edition extent funder idno sponsor
Note	May contain specialized bibliographic elements, in a prescribed order. The <monogr> element may only occur only within a <biblStruct>, where its use is mandatory for the description of a monographic-level bibliographic item.
Example	<pre> <biblStruct> <analytic> <author>Chesnutt, David</author> <title>Historical Editions in the States</title> </analytic> <monogr> <title level="j">Computers and the Humanities</title> <imprint> <date when="1991-12">(December, 1991):</date> </imprint> <biblScope>25.6</biblScope> <biblScope unit="page" from="377" to="380">377-380</biblScope> </monogr> </biblStruct> </pre>
Example	<pre> <biblStruct type="book"> <monogr> <author> <persName> <forename>Leo Joachim</forename> <surname>Frachtenberg</surname> </persName> </author> <title type="main" level="m">Lower Umpqua Texts</title> <imprint> <pubPlace>New York</pubPlace> <publisher>Columbia University Press</publisher> <date>1914</date> </imprint> </monogr> <series> <title type="main" level="s">Columbia University Contributions to Anthropology</title> <biblScope unit="volume">4</biblScope> </series> </biblStruct> </pre>

Member of	model.objectLike
Contained by	namesdates: listObject object
May contain	core: bibl biblStruct head listBibl note p header: biblFull linking: ab link linkGrp msdescription: additional history msContents msDesc physDesc namesdates: object objectIdentifier
Note	The <object> element is a recent addition to the TEI P5 Guidelines as of version 3.5.0 and as such may be more prone to further revision in the next few releases as its use develops. This may be particularly evident where its contents have been borrowed from <msDesc> and have yet to be generalized from their use in the context of manuscript descriptions.
Example	<pre> <listObject> <object xml:id="Alfred_Jewel"> <objectIdentifier> <country>United Kingdom</country> <region>Oxfordshire</region> <settlement>Oxford</settlement> <institution>University of Oxford</institution> <repository>Ashmolean Museum</repository> <collection>English Treasures</collection> <idno type="ashmolean">AN1836p.135.371</idno> <idno type="wikipedia">https://en.wikipedia.org/wiki/Alfred_Jewel</idno> <objectName>Alfred Jewel</objectName> </objectIdentifier> <physDesc> <p> The Alfred Jewel is about 6.4 cm in length and is made of combination of filigreed gold surrounding a polished teardrop shaped piece of transparent quartz. The sides of the jewel holding the jewel in place contain an openwork inscription saying "AELFRED MEC HEHT GEWYRCAN" meaning 'Alfred ordered'. </p> </physDesc> <history> <origin>It is generally accepted that the Alfred Jewel dates from the late 9th Century was most likely made in England. </origin> <provenance when="1693">The jewel was discovered in 1693 at Petherton Park, North Petherton in the English county of Somerset, on land owned by Sir Thomas Wroth. North Petherton is about 8 miles away from Athelney where King Alfred founded a monastery. </provenance> <provenance when="1698">A description of the Alfred Jewel was first published in 1698, in the Philosophical Transactions of the Royal Society.</provenance> <acquisition> It was bequeathed to Oxford University by Colonel Nathaniel Palmer (c. 1661-1718) and today is in the Ashmolean Museum in Oxford. </acquisition> </history> </object> </listObject> <!-- Elsewhere in document --> <p> The <objectName ref="#MinsterLovellJewel">Minster Lovell Jewel</objectName> is probably the most similar to #MinsterLovell" >Minster Lovell</objectName> and was found in <placeName ref="#MinsterLovell">Minster Lovell</placeName> in <placeName ref="#Oxfordshire">Oxfordshire</placeName> and is kept at the <orgName ref="#MinsterLovell">Minster Lovell</orgName></p> </pre>
Example	<pre> <listObject> <object xml:id="MaskOfTutankhamun"> <objectIdentifier> <objectName xml:lang="en">Mask of Tutankhamun</objectName> <idno type="carter">256a</idno> <idno type="JournalID'Entrée">60672</idno> <idno type="exhibition">220</idno> <institution>Museum of Egyptian Antiquities</institution> <address> <street>15 Meret Basha</street> <district>Ismailia</district> <settlement>Cairo</settlement> <country>Egypt</country> <location> <geo>30.047778, 31.233333</geo> </location> </address> </objectIdentifier> </object> </listObject> </pre>

	<pre> </location> </address> </objectIdentifier> <msContents> <p>The back and shoulders of the mask is inscribed with a protective spell in Egyptian hieroglyphs formed of vertical and horizontal lines. This spell first appeared on masks in the Middle Kingdom at least 500 years before Tutankhamun, and comes from chapter 151 of the <title>Book of the Dead</title>. </p> </msContents> <physDesc> <p>The mask of Tutankhamun is 54cm x 39.3cm x 49cm. It is constructed from two layers of high-karat gold that varies in thickness from 1.5-3mm. It weighs approximately 10.23kg and x-ray crystallography shows that it is composed of two alloys of gold with a lighter 18.4 karat shade being used for the face and neck while a 22.5 karat gold was used for the rest of the mask.</p> <p>In the mask Tutankhamun wears a nemes headcloth which has the royal insignia of a cobra (Wadjet) and vulture (Nekhbet) on it. These are thought respectively to symbolise Tutankhamun's rule of both Lower Egypt and Upper Egypt. His ears are pierced for earrings. The mask has rich inlays of coloured glass and gemstones, including lapis lazuli surrounding the eye and eyebrows, quartz for the eyes, obsidian for the pupils. The broad collar made up of carnelian, feldspar, turquoise, amazonite, faience and other stones.</p> </physDesc> <history> <origin> <p>The mask of Tutankhamun was created in <origPlace>Egypt</origPlace> around <origDate when="-1323" type="BC">who reigned 1332-1323 BC. </p> </origin> <provenance> <p>The mask of Tutankhamun was found in his burial chamber at Theban Necropolis in the Valley of the Kings in 1922. On 28 October 1925 the excavation team led by English archaeologist Howard Carter opened the he sarcophagus and three coffins and were the first people in around 3,250 years to see the mask of Tutankhamun. Carter wrote in his diary: <quote> The pins removed, the lid was raised. The penultimate scene was that of a very neatly wrapped mummy of the young king, with golden mask of sad but tranquil expression, symbolising Osiris ... the mask bears that god's attributes, but the likeness is that of Tutankhamun - placid and beautiful, with the same features as we find upon his statues and coffins. The mask has fallen slightly back, thus its gaze is straight up to the heavens. </quote> </p> </provenance> <acquisition> In December 1925, the mask was removed from the tomb, placed in a crate and transported 635 kilometres (395 mi) to the Egyptian Museum in Cairo, where it remains on public display. </acquisition> </history> <additional> <adminInfo> <custodialHist> <custEvent when="1944">When it was discovered in 1925, the 2.5kg narrow gold beard was no longer attached to the mask and was reattached to the chin by use of a wooden dowel in 1944. </custEvent> <custEvent when="2014-08"> In August 2014 when the mask was removed from its display case for cleaning, the beard fell off again. Those working in the museum unadvisedly used a quick-drying epoxy to attempt to fix it, but left the beard off-centre. </custEvent> <custEvent when="2015-01">The damage was noticed and repaired in January 2015 by a German-Egyptian team who used beeswax, a material known to be used as adhesives by the ancient Egyptians. </custEvent> </custodialHist> </adminInfo> </additional> </object> </listObject> </pre>

May contain	Empty element
Note	A <pb> element should appear at the start of the page which it identifies. The global <i>n</i> attribute indicates the number or other value associated with this page. This will normally be the page number or signature printed on it, since the physical sequence number is implicit in the presence of the <pb> element itself. The <i>type</i> attribute may be used to characterize the page break in any respect. The more specialized attributes <i>break</i> , <i>ed</i> , or <i>edRef</i> should be preferred when the intent is to indicate whether or not the page break is word-breaking, or to note the source from which it derives.
Example	Page numbers may vary in different editions of a text. <pre> <p> ... <pb n="145" ed="ed2"/> <!-- Page 145 in edition "ed2" starts here --> ... <pb n="283" ed="ed1"/> <!-- Page 283 in edition "ed1" starts here--> ... </p> </pre>

Example	A page break may be associated with a facsimile image of the page it introduces by means of the <i>facs</i> attribute <pre><body> <pb n="1" facs="page1.png"/> <!-- page1.png contains an image of the page; the text it contains is encoded here --&gt; &lt;p&gt; &lt;!-- ... --&gt; &lt;/p&gt; &lt;pb n="2" facs="page2.png"/&gt; <!-- similarly, for page 2 --&gt; &lt;p&gt; &lt;!-- ... --&gt; &lt;/p&gt; &lt;/body&gt;</pre> </pre>
Content model	<pre><content> <empty/> </content></pre>

	namesdates: <u>affiliation</u> <u>age</u> <u>birth</u> <u>death</u> <u>education</u> <u>event</u> <u>faith</u> <u>floruit</u> <u>langKnowledge</u> <u>listEvent</u> <u>nationality</u> <u>occupation</u> <u>persName</u> <u>persona</u> <u>residence</u> <u>sex</u> <u>socecStatus</u> <u>state</u> <u>trait</u> spoken: kinesic vocal transcr: addSpan delSpan fw listTranspose metamark space
Note	Note that a persona is not the same as a role. A role may be assumed by different people on different occasions, whereas a persona is unique to a particular person, even though it may resemble others. Similarly, when an actor takes on or enacts the role of a historical person, they do not thereby acquire a new persona.
Example	<pre><person sex="M" age="adult"> <persona sex="M"> <persName>Dr Henry Jekyll</persName> </persona> <persona sex="M" age="youth"> <persName>Edward Hyde</persName> </persona> </person></pre>

6.1.199. <prefixDef>

<prefixDef> (prefix definition) defines a prefixing scheme used in `data.pointer` values, showing how abbreviated URIs using the scheme may be expanded into full URIs. [16.2.3. Using Abbreviated Pointers]

Module	header						
Attributes	<p>Attributes <code>att.global</code> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<code>att.global.rendition</code> (@rend, @style, @rendition)) (<code>att.global.link</code> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<code>att.global.analytic</code> (@ana)) (<code>att.global.fac</code> (@fac)) (<code>att.global.change</code> (@change)) (<code>att.global.responsibility</code> (@cert, @resp)) (<code>att.global.source</code> (@source)) <code>att.patternReplacement</code> (@matchPattern, @replacementPattern)</p> <p>ident supplies a name which functions as the prefix for an abbreviated pointing scheme such as a private URI scheme. The prefix constitutes the text preceding the first colon.</p> <table> <tr> <td>Status</td> <td>Required</td> </tr> <tr> <td>Datatype</td> <td><code>teidata.prefix</code></td> </tr> <tr> <td>Note</td> <td>The value is limited to <code>teidata.prefix</code> so that it may be mapped directly to a URI prefix.</td> </tr> </table>	Status	Required	Datatype	<code>teidata.prefix</code>	Note	The value is limited to <code>teidata.prefix</code> so that it may be mapped directly to a URI prefix.
Status	Required						
Datatype	<code>teidata.prefix</code>						
Note	The value is limited to <code>teidata.prefix</code> so that it may be mapped directly to a URI prefix.						

Contained by	—
May contain	core: p linking: ab
Note	The abbreviated pointer may be dereferenced to produce either an absolute or a relative URI reference. In the latter case it is combined with the value of <i>xml:base</i> in force at the place where the pointing attribute occurs to form an absolute URI in the usual manner as prescribed by XML Base.
Example	<pre><prefixDef ident="ref" matchPattern="([a-z]+)" replacementPattern="../../references/references.xml#\${1}"> <p> In the context of this project, private URIs with the prefix "ref" point to <gi>div</gi> elements in the project's global references.xml file. </p> </prefixDef></pre>
Content model	<pre><content> <classRef key="model.pLike" minOccurs="0" maxOccurs="unbounded"/> </content></pre>
Schema Declaration	<pre>element prefixDef { tei_att.global.attributes, tei_att.patternReplacement.attributes, attribute ident { text }, tei_model.pLike* }</pre>

6.1.200. <*principal*>

<*principal*> (principal researcher) supplies the name of the principal researcher responsible for the creation of an electronic text. [2.2.1. The Title Statement]

Note	The <i>target</i> and <i>cRef</i> attributes are mutually exclusive.
Example	See especially <ref target="http://www.natcorp.ox.ac.uk/Texts/A02.xml#s2">the second sentence</ref>
Example	See also <ref target="#locution">s.v. <term>locution</term></ref>.
Schematron	<s:report test="@target and @cRef">Only one of the attributes '@target' and '@cRef' may be supplied on <s:name/> </s:report>
Content model	<pre><content> <macroRef key="macro.paraContent" /> </content></pre>
Schema Declaration	<pre>element ref { tei_att.global.attributes, tei_att.pointing.attributes, tei_att.internetMedia.attributes, tei_att.typed.attributes, tei_att.declaring.attributes, tei_att.cReferencing.attributes, tei_macro.paraContent }</pre>

6.1.213. <refState>

<refState> (reference state) specifies one component of a canonical reference defined by the milestone method. [2.3.6.3. Milestone Method 2.3.6. The Reference System Declaration]	
Module	header
Attributes	<p>Attributes <u>att.global</u> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<u>att.global.rendition</u> (@rend, @style, @rendition)) (<u>att.global.linking</u> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<u>att.global.analytic</u> (@ana)) (<u>att.global.facs</u> (@facs)) (<u>att.global.change</u> (@change)) (<u>att.global.responsibility</u> (@cert, @resp)) (<u>att.global.source</u> (@source)) <u>att.milestoneUnit</u> (@unit) <u>att.edition</u> (@ed, @edRef)</p> <p>length specifies the fixed length of the reference component.</p> <p>Status Optional</p> <p>Datatype <u>teidata.count</u></p> <p>Note When constructing a reference, if the reference component found is of numeric type, the length is made up by inserting leading zeros; if it is not, by inserting trailing blanks. In either case, reference components are truncated if necessary at the right hand side. When seeking a reference, the length indicates the number of characters which should be compared. Values longer than this will be regarded as matching, if they start correctly. If no value is provided, the length is unlimited and goes to the next delimiter or to the end of the value.</p> <p>delim (delimiter) supplies a delimiting string following the reference component.</p> <p>Status Optional</p> <p>Datatype <u>teidata.text</u></p>

Contained by	header: <code>refsDecl</code>
May contain	Empty element
Example	<pre><refState unit="book" delim=":"/> <refState unit="line" length="4"/></pre>
Content model	<pre><content> <empty/> </content></pre>
Schema Declaration	<pre>element refState { tei_att.global.attributes, tei_att.milestoneUnit.attributes, tei_att.edition.attributes, attribute length { text }?, attribute delim { text }?, empty }</pre>

6.1.214. `<refsDecl>`

`<refsDecl>` (references declaration) specifies how canonical references are constructed for this text. [2.3.6.3. Milestone Method 2.3. The Encoding Description 2.3.6. The Reference System Declaration]

Module	header
Attributes	Attributes <code>att.global</code> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<code>att.global.rendition</code> (@rend, @style, @rendition)) (<code>att.global.linking</code> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<code>att.global.analytic</code> (@ana)) (<code>att.global.facs</code> (@facs)) (<code>att.global.change</code> (@change)) (<code>att.global.responsibility</code> (@cert, @resp)) (<code>att.global.source</code> (@source)) <code>att.declarable</code> (@default)
Member of	<code>model.encodingDescPart</code>
Contained by	header: <code>encodingDesc</code>
May contain	core: <code>p</code> header: <code>refState</code> linking: <code>ab</code>
Example	<pre><refsDecl> <cRefPattern matchPattern="([A-Za-z0-9]+) ([0-9]+):([0-9]+)" replacementPattern="#xpath(//body/div[@n='\$1']/div[\$2]/div3[\$3])"/> </refsDecl></pre> <p>This example is a formal representation for the referencing scheme described informally in the following example.</p>
Example	<pre><refsDecl> <p>References are made up by concatenating the value for the <att:n</att> attribute on the highest level <gi>div</gi> element, followed by a space, followed by the sequential number of the next level <gi>div</gi> followed by a colon followed by the sequential number of the next (and lowest) level <gi>div</gi>. </p> </refsDecl></pre>

Note	The <seg> element may be used at the encoder's discretion to mark any segments of the text of interest for processing. One use of the element is to mark text features for which no appropriate markup is otherwise defined. Another use is to provide an identifier for some segment which is to be pointed at by some other element—i.e. to provide a target, or a part of a target, for a <ptr> or other similar element.
Example	<pre><seg>When are you leaving?</seg> <seg>Tomorrow.</seg></pre>

Example	<pre><s> <seg rend="caps" type="initial-cap">So father's only</seg> glory was the ballfield. </s></pre>
Example	<pre><seg type="preamble"> <seg>Sigmund, <seg type="patronym">the son of Volsung</seg>, was a king in Frankish country.</seg> <seg>Sinfiotli was the eldest of his sons ...</seg> <seg>Borghild, Sigmund's wife, had a brother ... </seg> </seg></pre>

Note	As with other culturally-constructed traits such as age, the way in which this concept is described in different cultural contexts may vary. The normalizing attributes are provided only as an optional means of simplifying that variety to one or more external standards for purposes of interoperability, or project-internal taxonomies for consistency, and should not be used where that is inappropriate or unhelpful. The content of the element may be used to describe the intended concept in more detail, using plain text.
Example	<code><sex value="M">male</sex></code>
Example	<code><sex value="2">female</sex></code>
Example	<code><sex value="I">Intersex</sex></code>
Example	<code><sex value="TG F">Female (TransWoman)</sex></code>

May contain	<p>core: <u>bibl</u> <u>biblStruct</u> <u>desc</u> <u>head</u> <u>label</u> <u>listBibl</u> <u>note</u> <u>p</u> header: <u>biblFull</u> linking: <u>ab</u> msdescription: <u>msDesc</u> namesdates: <u>state</u></p>
Note	Where there is confusion between <u><trait></u> and <u><state></u> the more general purpose element <u><state></u> should be used even for unchanging characteristics. If you wish to distinguish between characteristics that are generally perceived to be time-bound states and those assumed to be fixed traits, then <u><trait></u> is available for the more static of these. The <u><state></u> element encodes characteristics which are sometimes assumed to change, often at specific times or over a date range, whereas the <u><trait></u> elements are used to record characteristics, such as eye-colour, which are less subject to change. Traits are typically, but not necessarily, independent of the volition or action of the holder.
Example	<pre><state ref="#SCHOL" type="status"> <label>scholar</label> </state></pre>
Example	<pre><org> <orgName notAfter="1960">The Silver Beetles</orgName> <orgName notBefore="1960">The Beatles</orgName> <state type="membership" from="1960-08" to="1962-05"> <desc> <persName>John Lennon</persName> <persName>Paul McCartney</persName> <persName>George Harrison</persName> <persName>Stuart Sutcliffe</persName> <persName>Pete Best</persName> </desc> </state> <state type="membership" notBefore="1963"> <desc> <persName>John Lennon</persName> <persName>Paul McCartney</persName> <persName>George Harrison</persName> <persName>Ringo Starr</persName> </desc> </state> </org></pre>

Note	<p>When this element appears within an <code><index></code> element, it is understood to supply the form under which an index entry is to be made for that location. Elsewhere, it is understood simply to indicate that its content is to be regarded as a technical or specialised term. It may be associated with a <code><gloss></code> element by means of its <code>ref</code> attribute; alternatively a <code><gloss></code> element may point to a <code><term></code> element by means of its <code>target</code> attribute.</p> <p>In formal terminological work, there is frequently discussion over whether terms must be atomic or may include multi-word lexical items, symbolic designations, or phraseological units. The <code><term></code> element may be used to mark any of these. No position is taken on the philosophical issue of what a term can be; the looser definition simply allows the <code><term></code> element to be used by practitioners of any persuasion.</p> <p>As with other members of the <code>att.canonical</code> class, instances of this element occurring in a text may be associated with a canonical definition, either by means of a URI (using the <code>ref</code> attribute), or by means of some system-specific code value (using the <code>key</code> attribute). Because the mutually exclusive <code>target</code> and <code>cRef</code> attributes overlap with the function of the <code>ref</code> attribute, they are deprecated and may be removed at a subsequent release.</p>
Example	A computational device that infers structure from grammatical strings of words is known as a <code><term>parser</term></code> , and much of the history of NLP over the last 20 years has been occupied with the design of parsers.
Example	We may define <code><term xml:id="#TDPV1" rend="sc">discoursal point of view</term></code> as <code><gloss target="#TDPV1">the relationship, expressed through discourse structure, between the implied author or some other addresser, and the fiction.</gloss></code>
Example	We may define <code><term ref="#TDPV2" rend="sc">discoursal point of view</term></code> as <code><gloss xml:id="TDPV2">the relationship, expressed</code>

	<pre>through discourse structure, between the implied author or some other addresser, and the fiction.</gloss></pre>
Example	We discuss Leech's concept of <term ref="myGlossary.xml#TDPV2" rend="sc">discursal point</term> below.
Content model	<pre><content> <macroRef key="macro.phraseSeq"/> </content></pre>
Schema Declaration	<pre>element term { tei_att.global.attributes, tei_att.declaring.attributes, tei_att.pointing.attributes, tei_att.typed.attributes, tei_att.canonical.attributes, tei_att.sortable.attributes, tei_att.cReferencing.attributes, tei_macro.phraseSeq }</pre>

6.1.266. <terrain>

<terrain> contains information about the physical terrain of a place. [13.3.4.3. States, Traits, and Events]

Note	This element should not be used to document the languages or writing systems used for the bibliographic or manuscript description itself: as for all other TEI elements, such information should be provided by means of the global <i>xml:lang</i> attribute attached to the element containing the description. In all cases, languages should be identified by means of a standardized ‘language tag’ generated according to BCP 47. Additional documentation for the language may be provided by a <i><language></i> element in the TEI Header.
Example	<pre><textLang mainLang="en" otherLangs="la"> Predominantly in English with Latin glosses</textLang></pre>
Content model	<pre><content> <macroRef key="macro.phraseSeq"/> </content></pre>

6.1.271. <title>

<title> contains a title for any kind of work. [3.11.2.2. Titles, Authors, and Editors 2.2.1. The Title Statement 2.2.5. The Series Statement]	
Module core Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendering (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.analytic (@ana)) (att.global.facs (@fac)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.canonical (@key, @ref) att.datable (@calendar, @period) (att.datable.w3c (@when, @notBefore, @notAfter, @from, @to)) (att.datable.iso (@when-iso, @notBefore-iso, @notAfter-iso, @from-iso, @to-iso)) (att.datable.custom (@when-custom, @notBefore-custom, @notAfter-custom, @from-custom, @to-custom, @datingPoint, @datingMethod)) att.typed (type, @subtype) type classifies the title according to some convenient typology. Derived from Status Optional Datatype teidata.enumerated Sample values include: main sub (subordinate) subtitle, title of part	

	<p>alt (alternate) alternate title, often in another language, by which the work is also known</p> <p>short abbreviated form of title</p> <p>de- sc (descriptive) descriptive paraphrase of the work functioning as a title</p> <p>Note This attribute is provided for convenience in analysing titles and processing them according to their type; where such specialized processing is not necessary, there is no need for such analysis, and the entire title, including subtitles and any parallel titles, may be enclosed within a single <code><title></code> element.</p>
level	indicates the bibliographic level for a title, that is, whether it identifies an article, book, journal, series, or unpublished material.
	<p>Status Optional</p> <p>Datatype <code>teidata.enumerated</code></p> <p>Legal values a are: (analytic) the title applies to an analytic item, such as an article, poem, or other work published as part of a larger item.</p> <p>m (monographic) the title applies to a monograph such as a book or other item considered to be a distinct publication, including single volumes of multi-volume works</p> <p>j (journal) the title applies to any serial or periodical publication such as a journal, magazine, or newspaper</p> <p>s (series) the title applies to a series of otherwise distinct publications such as a collection</p> <p>u (unpublished) the title applies to any unpublished material (including theses and dissertations unless published by a commercial press)</p> <p>Note The level of a title is sometimes implied by its context: for example, a title appearing directly within an <code><analytic></code> element is <i>ipso facto</i> of level 'a', and one appearing within a <code><series></code> element of level 's'. For this reason, the <code>level</code> attribute is not required in contexts where its value can be unambiguously inferred. Where it is supplied in such contexts, its value should not contradict the value implied by its parent element.</p>

Note	Where there is confusion between <code><trait></code> and <code><state></code> the more general purpose element <code><state></code> should be used even for unchanging characteristics. If you wish to distinguish between characteristics that are generally perceived to be time-bound states and those assumed to be fixed traits, then <code><trait></code> is available for the more static of these. The <code><state></code> element encodes characteristics which are sometimes assumed to change, often at specific times or over a date range, whereas the <code><trait></code> elements are used to record characteristics, such as eye-colour, which are less subject to change. Traits are typically, but not necessarily, independent of the volition or action of the holder.
Example	<pre><trait type="physical"> <label>Eye colour</label> <desc>Blue</desc> </trait></pre>
Content model	<pre><content> <sequence> <elementRef key="precision" minOccurs="0" maxOccurs="unbounded"/> <altermate> <elementRef key="trait" minOccurs="1" maxOccurs="unbounded"/> <sequence> <classRef key="model.headLike" minOccurs="0" maxOccurs="unbounded"/> <classRef key="model.pLike" minOccurs="1" maxOccurs="unbounded"/> <altermate minOccurs="0" maxOccurs="unbounded"> <classRef key="model.noteLike"/> <classRef key="model.biblLike"/> </altermate> </sequence> <altermate minOccurs="0" maxOccurs="unbounded"> <classRef key="model.labelLike"/> <classRef key="model.noteLike"/> <classRef key="model.biblLike"/> </altermate> </sequence> </content></pre>
Schema Declaration	<pre>element trait { tei_att.global.attributes, tei_att.database.attributes, tei_att.editLike.attributes, tei_att.naming.attributes, tei_att.typed.attributes, tei_att.dimensions.attributes, (precision*, (tei_trait+ (tei_model.headLike*, tei_model.pLike, (tei_model.noteLike tei_model.biblLike)*) (tei_model.labelLike tei_model.noteLike tei_model.biblLike)*)) }</pre>

}

6.1.275. *<transpose>*

<transpose> describes a single textual transposition as an ordered list of at least two pointers specifying the order in which the elements indicated should be re-combined. [11.3.4.5. Transpositions]

Module	transcr
Attributes	Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @style, @rendition)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.analytic (@ana)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))
Contained by	transcr: listTranspose
May contain	core: ptr
Note	Transposition is usually indicated in a document by a metemark such as a wavy line or numbering. The order in which <code><ptr></code> elements appear within a <code><transpose></code> element should correspond with the desired order, as indicated by the metemark.
Example	<pre><transpose> <ptr target="#ib02"/> <ptr target="#ib01"/> </transpose></pre> <p>The transposition recorded here indicates that the content of the element with identifier ib02 should appear before the content of the element with identifier ib01.</p>
Content model	<pre><content> <sequence> <elementRef key="ptr"/> <elementRef key="ptr" minOccurs="1" maxOccurs="unbounded"/> </sequence> </content></pre>
Schema Declaration	<code>element transpose { tei_att.global.attributes, (tei_ptr, tei_ptr+) }</code>

6.1.276. *<unclear>*

<unclear> contains a word, phrase, or passage which cannot be transcribed with certainty because it is illegible or inaudible in the source. [11.3.3.1. Damage, Illegibility, and Supplied Text 3.4.3. Additions, Deletions, and Omissions]

May contain	gaiji: g character data
Note	If used to specify the depth of a non text-bearing portion of some object, for example a monument, this element conventionally refers to the axis facing the observer, and perpendicular to that indicated by the ‘depth’ axis.
Example	<width unit="in">4</width>
Content model	<pre> <content> <macroRef key="macro.xtext" /> </content> </pre>
Schema Declaration	<pre> element width { tei_att.global.attributes, tei_att.dimensions.attributes, tei_macro.xtext } </pre>

6.1.281. <xenoData>

<xenoData> (non-TEI metadata) provides a container element into which metadata in non-TEI formats may be placed. [2.5. Non-TEI Metadata]

Module	header
Attributes	Attributes <u>att.global</u> (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (<u>att.global.rendition</u> (@rend, @style, @rendition)) (<u>att.global.linking</u> (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (<u>att.global.analytic</u> (@ana)) (<u>att.global.facs</u> (@facs)) (<u>att.global.change</u> (@change)) (<u>att.global.responsibility</u> (@cert, @resp)) (<u>att.global.source</u> (@source)) <u>att.declarable</u> (@default) <u>att.typed</u> (@type, @subtype)
Member of	<u>model.teiHeaderPart</u>
Contained by	header: teiHeader
May contain	Character data only

Example	<p>This example presumes that the prefix dc has been bound to the namespace <code>http://purl.org/dc/elements/1.1/</code> and the prefix rdf is bound to the namespace <code>http://www.w3.org/1999/02/22-rdf-syntax-ns#</code>. Note: The <code>about</code> attribute on the <code><rdf:Description></code> in this example gives a URI indicating the resource to which the metadata contained therein refer. The <code><rdf:Description></code> in the second <code><xenoData></code> block has a blank <code>about</code>, meaning it is pointing at the <i>current</i> document, so the RDF is about the document within which it is contained, i.e. the TEI document containing the <code><xenoData></code> block. Similarly, any kind of relative URI may be used, including fragment identifiers (see). Do note, however, that if the contents of the <code><xenoData></code> block are to be extracted and used elsewhere, any relative URIs will have to be resolved accordingly.</p> <pre data-bbox="527 563 1357 1012"><xenoData xmlns:dc="http://purl.org/dc/elements/1.1/" xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#" <rdf:RDF> <rdf:Description rdf:about="http://www.worldcat.org/oclc/606621663"> <dc:title>The description of a new world, called the blazing-world</dc:title> <dc:creator>The Duchess of Newcastle</dc:creator> <dc:date>1667</dc:date> <dc:identifier>British Library, 8407.h.10</dc:identifier> <dc:subject>utopian fiction</dc:subject> </rdf:Description> </rdf:RDF> </xenoData> <xenoData> <rdf:RDF> <rdf:Description rdf:about=""> <dc:title>The Description of a New World, Called the Blazing-World, 1668</dc:title> <dc:creator>Cavendish, Margaret (Lucas), Duchess of Newcastle</dc:creator> <dc:publisher>Women Writers Project</dc:publisher> <dc:date>2002-02-12</dc:date> <dc:subject>utopian fiction</dc:subject> </rdf:Description> </rdf:RDF> </xenoData></pre>
Example	<p>In this example, the prefix rdf is bound to the namespace <code>http://www.w3.org/1999/02/22-rdf-syntax-ns#</code>, the prefix dc is bound to the namespace <code>http://purl.org/dc/elements/1.1/</code>, and the prefix cc is bound to the namespace <code>http://web.resource.org/cc/</code>.</p> <pre data-bbox="527 1158 1309 1540"><xenoData xmlns:cc="http://web.resource.org/cc/" xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#" xmlns:dc="http://purl.org/dc/elements/1.1/" <rdf:RDF> <cc:Work rdf:about=""> <dc:title>Applied Software Project Management - review</dc:title> <dc:type rdf:resource="http://purl.org/dc/dcmitype/Text"/> <dc:license rdf:resource="http://creativecommons.org/licenses/by-sa/2.0/uk/" /> </cc:Work> <cc:License rdf:about="http://creativecommons.org/licenses/by-sa/2.0/uk/"> <cc:permits rdf:resource="http://web.resource.org/cc/Reproduction"/> <cc:permits rdf:resource="http://web.resource.org/cc/Distribution"/> <cc:requires rdf:resource="http://web.resource.org/cc/Notice"/> <cc:requires rdf:resource="http://web.resource.org/cc/Attribution"/> <cc:permits rdf:resource="http://web.resource.org/cc/DerivativeWorks"/> <cc:requires rdf:resource="http://web.resource.org/cc/ShareAlike"/> </cc:License> </rdf:RDF> </xenoData></pre>
Example	<p>In this example, the prefix dc is again bound to the namespace <code>http://www.openarchives.org/OAI/2.0/oai_dc/</code>, and the prefix oai_dc is bound to the namespace <code>http://www.openarchives.org/OAI/2.0/oai_dc/</code>.</p> <pre data-bbox="527 1641 1341 1974"><xenoData xmlns:oai_dc="http://www.openarchives.org/OAI/2.0/oai_dc/" xmlns:dc="http://purl.org/dc/elements/1.1/" <oai_dc:dc> <dc:title>The colonial despatches of Vancouver Island and British Columbia 1846-1871: 11566, CO 60/2, p. 291; received 13 November. Members	model.imprintPart[biblScope distributor pubPlace publisher] model.respLike[author editor funder principal respStmt sponsor] availability bibl citedRange edition extent listRelation msIdentifier objectIdentifier relatedItem series textLang

6.2.6. *model.castItemPart*

model.castItemPart groups component elements of an entry in a cast list, such as dramatic role or actor's name.	
Module	tei
Used by	castItem
Members	role roleDesc

6.2.7. *model.choicePart*

model.choicePart groups elements (other than <code><choice></code> itself) which can be used within a <code><choice></code> alternation. [3.4. Simple Editorial Changes]	
Module	tei
Used by	choice
Members	abbr corr expan orig reg seg sic supplied unclear

6.2.8. *model.common*

model.common groups common chunk- and inter-level elements. [1.3. The TEI Class System]	
Module	tei
Used by	argument body castList div epigraph figure postscript
Members	model.divPart[model.divPart.spoken model.lLike[l] model.pLike[ab p] lg sp] model.inter[model.biblLike[bibl biblFull biblStruct listBibl msDesc] model.egLike model.labelLike[desc label] model.listLike[list listEvent listNym listObject listOrg listPerson listPlace listRelation table] model.oddDecl model.qLike[model.quoteLike[cit quote] floatingText q] model.stageLike[stage] castList]
Note	This class defines the set of chunk- and inter-level elements; it is used in many content models, including those for textual divisions.

6.2.9. *model.correspActionPart*

model.correspActionPart groups elements which define the parts (usually names, dates and places) of one action related to the correspondence.	
Module	tei
Used by	correspAction
Members	model.addressLike[address affiliation] model.dateLike[date time] model.nameLike[model.nameLike.agent[name orgName persName] model.offsetLike[geogFeat offset] model.persNamePart[addName forename genName nameLink roleName surname] model.placeStateLike[model.placeNamePart[bloc country district geogName placeName region settlement] climate location population state terrain trait] idno objectName rs] note

6.2.10. *model.correspContextPart*

model.correspContextPart groups elements which may appear as part of the correspContext element	
Module	tei
Used by	correspContext
Members	model.pLike[ab p] model.ptrLike[ptr ref] note

6.2.11. *model.correspDescPart*

model.correspDescPart groups together metadata elements for describing correspondence	
Module	tei

Used by	correspDesc
Members	correspAction correspContext note

6.2.12. *model.dateLike*

model.dateLike groups elements containing temporal expressions. [3.5.4. Dates and Times 13.3.7. Dates and Times]	
Module	tei
Used by	imprint model.correspActionPart model.pPart.data
Members	date time

6.2.13. *model.descLike*

model.descLike groups elements which contain a description of their function.	
Module	tei
Used by	gap graphic kinesic media schemaRef space vocal
Members	desc

6.2.14. *model.dimLike*

model.dimLike groups elements which describe a measurement forming part of the physical dimensions of some object.	
Module	tei
Used by	dimensions
Members	height width

6.2.15. *model.divBottom*

model.divBottom groups elements appearing at the end of a text division. [4.2. Elements Common to All Divisions]	
Module	tei
Used by	body div figure front lg list table
Members	model.divBottomPart [closer postscript signed trailer] model.divWrapper [argument byline dateline docDate epigraph salute]

6.2.16. *model.divBottomPart*

model.divBottomPart groups elements which can occur only at the end of a text division. [4.6. Title Pages]	
Module	tei
Used by	back model.divBottom postscript
Members	closer postscript signed trailer

6.2.17. *model.divGenLike*

model.divGenLike groups elements used to represent a structural division which is generated rather than explicitly present in the source.	
Module	tei
Used by	body div
Members	divGen

6.2.18. *model.divLike*

model.divLike groups elements used to represent un-numbered generic structural divisions.	
Module	tei
Used by	back body div front
Members	div

6.2.19. *model.divPart*

model.divPart groups paragraph-level elements appearing directly within divisions. [1.3. The TEI Class System]

Module	tei
Used by	<u>macro.specialPara</u> <u>model.common</u>
Members	model.divPart.spoken <u>model.lLike[l]</u> <u>model.pLike[ab p]</u> <u>lg</u> <u>sp</u>
Note	Note that this element class does not include members of the <u>model.inter</u> class, which can appear either within or between paragraph-level items.

6.2.20. *model.divTop*

model.divTop groups elements appearing at the beginning of a text division. [4.2. Elements Common to All Divisions]	
Module	tei
Used by	<u>body</u> <u>castList</u> <u>div</u> <u>lg</u> <u>list</u>
Members	<u>model.divTopPart</u> [<u>model.headLike[head]</u> <u>opener</u> <u>signed</u>] <u>model.divWrapper</u> [<u>argument</u> <u>by-line</u> <u>dateline</u> <u>docDate</u> <u>epigraph</u> <u>salute</u>]

6.2.21. *model.divTopPart*

model.divTopPart groups elements which can occur only at the beginning of a text division. [4.6. Title Pages]	
Module	tei
Used by	<u>model.divTop</u> <u>postscript</u>
Members	<u>model.headLike[head]</u> <u>opener</u> <u>signed</u>

6.2.22. *model.divWrapper*

model.divWrapper groups elements which can appear at either top or bottom of a textual division. [4.2. Elements Common to All Divisions]	
Module	tei
Used by	<u>model.divBottom</u> <u>model.divTop</u>
Members	<u>argument</u> <u>byline</u> <u>dateline</u> <u>docDate</u> <u>epigraph</u> <u>salute</u>

6.2.23. *model.editorialDeclPart*

model.editorialDeclPart groups elements which may be used inside <u><editorialDecl></u> and appear multiple times.	
Module	tei
Used by	<u>editorialDecl</u>
Members	<u>correction</u> <u>hyphenation</u> <u>interpretation</u> <u>normalization</u> <u>punctuation</u> <u>quotation</u> <u>segmentation</u> <u>std-Vals</u>

6.2.24. *model.emphLike*

model.emphLike groups phrase-level elements which are typographically distinct and to which a specific function can be attributed. [3.3. Highlighting and Quotation]	
Module	tei
Used by	<u>model.highlighted</u> <u>model.limitedPhrase</u>
Members	<u>distinct</u> <u>emph</u> <u>foreign</u> <u>mentioned</u> <u>soCalled</u> <u>term</u> <u>title</u>

6.2.25. *model.encodingDescPart*

model.encodingDescPart groups elements which may be used inside <u><encodingDesc></u> and appear multiple times.	
Module	tei
Used by	<u>encodingDesc</u>
Members	<u>editorialDecl</u> <u>geoDecl</u> <u>projectDesc</u> <u>refsDecl</u> <u>schemaRef</u>

6.2.26. *model.eventLike*

model.eventLike groups elements which describe events.	
Module	tei

Used by	listEvent model.orgPart model.personPart place
Members	event listEvent

6.2.27. *model.frontPart*

model.frontPart groups elements which appear at the level of divisions within front or back matter. [7.1. Front and Back Matter]

Module	tei
Used by	back front
Members	model.frontPart.drama[castList] divGen listBibl

6.2.28. *model.frontPart.drama*

model.frontPart.drama groups elements which appear at the level of divisions within front or back matter of performance texts only. [7.1. Front and Back Matter]

Module	tei
Used by	model.frontPart
Members	castList

6.2.29. *model.gLike*

model.gLike groups elements used to represent individual non-Unicode characters or glyphs.

Module	tei
Used by	bibl byline castItem closer date dateline head idno l macro . paraContent macro . phraseSeq macro . specialPara macro . xtext measureGrp msName opener origDate pc series time trailer

6.2.31. *model.global.edit*

model.global.edit groups globally available elements which perform a specifically editorial function. [1.3. The TEI Class System]

Module	tei
Used by	model.global
Members	addSpan delSpan gap space

6.2.32. *model.global.meta*

model.global.meta groups globally available elements which describe the status of other elements. [1.3. The TEI Class System]

Module	tei
Used by	model.global
Members	index link linkGrp listTranspose
Note	Elements in this class are typically used to hold groups of links or of abstract interpretations, or by provide indications of certainty etc. It may find be convenient to localize all metadata elements, for example to contain them within the same division as the elements that they

relate to; or to locate them all to a division of their own. They may however appear at any point in a TEI text.

6.2.33. *model.global.spoken*

model.global.spoken groups elements which may appear globally within spoken texts. [8.1. General Considerations and Overview]	
Module	spoken
Used by	model.global
Members	kinesic vocal
Note	This class groups elements which can appear anywhere within transcribed speech.

6.2.34. *model.graphicLike*

model.graphicLike groups elements containing images, formulae, and similar objects. [3.9. Graphics and Other Non-textual Components]	
Module	tei
Used by	facsimile figure model.phrase surface table zone
Members	binaryObject graphic media

6.2.35. *model.headLike*

model.headLike groups elements used to provide a title or heading at the start of a text division.	
Module	tei
Used by	argument climate divGen event figure listBibl listEvent listNym listObject listOrg listPerson listPlace listRelation model.divTopPart msDesc object org place population state table terrain trait
Members	head

6.2.36. *model.hiLike*

model.hiLike groups phrase-level elements which are typographically distinct but to which no specific function can be attributed. [3.3. Highlighting and Quotation]	
Module	tei
Used by	model.highlighted model.limitedPhrase model.linePart
Members	hi

6.2.37. *model.highlighted*

model.highlighted groups phrase-level elements which are typographically distinct. [3.3. Highlighting and Quotation]	
Module	tei
Used by	bibl model.phrase
Members	model.emphLike[distinct emph foreign mentioned soCalled term title] model.hiLike[hi]

Note	This class of elements can occur within paragraphs, list items, lines of verse, etc.

6.2.67. *model.physDescPart*

model.physDescPart groups specialized elements forming part of the physical description of a manuscript or similar written source.	
Module	msdescription
Used by	<u>physDesc</u>
Members	<u>accMat</u> <u>additions</u> <u>bindingDesc</u> <u>decoDesc</u> <u>handDesc</u> <u>objectDesc</u> <u>sealDesc</u>

6.2.68. *model.placeLike*

model.placeLike groups elements used to provide information about places and their relationships.	
Module	tei
Used by	<u>listPlace</u> <u>org</u> <u>place</u>
Members	<u>place</u>

6.2.69. *model.placeNamePart*

model.placeNamePart groups elements which form part of a place name. [13.2.3. Place Names]	
Module	tei
Used by	<u>altIdentifier</u> <u>location</u> <u>model.placeStateLike</u> <u>objectIdentifier</u>
Members	<u>bloc</u> <u>country</u> <u>district</u> <u>geogName</u> <u>placeName</u> <u>region</u> <u>settlement</u>

6.2.70. *model.placeStateLike*

model.placeStateLike groups elements which describe changing states of a place.	
Module	tei

Used by	<u>model.nameLike</u> <u>msIdentifier</u> <u>place</u>
Members	<u>model.placeNamePart</u> [<u>bloc</u> <u>country</u> <u>district</u> <u>geogName</u> <u>placeName</u> <u>region</u> <u>settlement</u>] <u>climate</u> <u>location</u> <u>population</u> <u>state</u> <u>terrain</u> <u>trait</u>

6.2.71. *model.profileDescPart*

model.profileDescPart groups elements which may be used inside <u><profileDesc></u> and appear multiple times.	
Module	<u>tei</u>
Used by	<u>profileDesc</u>
Members	<u>abstract</u> <u>calendarDesc</u> <u>correspDesc</u> <u>creation</u> <u>handNotes</u> <u>langUsage</u> <u>listTranspose</u> <u>textClass</u>

6.2.72. *model.ptrLike*

model.ptrLike groups elements used for purposes of location and reference. [3.6. Simple Links and Cross-References]	
Module	<u>tei</u>
Used by	<u>analytic</u> <u>bibl</u> <u>biblStruct</u> <u>cit</u> <u>model.correspContextPart</u> <u>model.limitedPhrase</u> <u>model.phrase</u> <u>model.publicationStmtPart.detail</u> <u>monogr</u> <u>relatedItem</u> <u>series</u>
Members	<u>ptr</u> <u>ref</u>

6.2.73. *model.publicationStmtPart.agency*

model.publicationStmtPart.agency groups the child elements of a <u><publicationStmt></u> element of the TEI header that indicate an authorising agent. [2.2.4. Publication, Distribution, Licensing, etc.]	
Module	<u>tei</u>
Used by	<u>publicationStmt</u>
Members	<u>authority</u> <u>distributor</u> <u>publisher</u>
Note	The ‘agency’ child elements, while not required, are required if one of the ‘detail’ child elements is to be used. It is not valid to have a ‘detail’ child element without a preceding ‘agency’ child element. See also <u>model.publicationStmtPart.detail</u> .

6.2.74. *model.publicationStmtPart.detail*

model.publicationStmtPart.detail groups the agency-specific child elements of the <u><publicationStmt></u> element of the TEI header. [2.2.4. Publication, Distribution, Licensing, etc.]	
Module	<u>tei</u>
Used by	<u>publicationStmt</u>
Members	<u>model.ptrLike</u> [<u>ptr</u> <u>ref</u>] <u>address</u> <u>availability</u> <u>date</u> <u>idno</u> <u>pubPlace</u>
Note	A ‘detail’ child element may not occur unless an ‘agency’ child element precedes it. See also <u>model.publicationStmtPart.agency</u> .

6.2.75. *model.qLike*

model.qLike groups elements related to highlighting which can appear either within or between chunk-level elements. [3.3. Highlighting and Quotation]	
Module	<u>tei</u>
Used by	<u>cit</u> <u>macro</u> . <u>phraseSeq</u> <u>model.inter</u> <u>sp</u>
Members	<u>model.quoteLike</u> [<u>cit</u> <u>quote</u>] <u>floatingText</u> <u>q</u>

6.2.76. *model.quoteLike*

model.quoteLike groups elements used to directly contain quotations.	
Module	<u>tei</u>
Used by	<u>model.msItemPart</u> <u>model.qLike</u>
Members	<u>cit</u> <u>quote</u>

6.2.77. *model.resourceLike*

model.resourceLike groups separate elements which constitute the content of a digital resource, as opposed to its metadata. [1.3. The TEI Class System]

Module	tei
Used by	TEI teiCorpus
Members	facsimile text

6.2.78. *model.respLike*

model.respLike groups elements which are used to indicate intellectual or other significant responsibility, for example within a bibliographic element.

Module	tei
Used by	editionStmt model.biblPart model.msItemPart titleStmt
Members	author editor funder principal respStmt sponsor

6.2.79. *model.segLike*

model.segLike groups elements used for arbitrary segmentation. [16.3. Blocks, Segments, and Anchors 17.1. Linguistic Segment Categories]

Module	tei
Used by	bibl model.phrase
Members	pc seg
Note	The principles on which segmentation is carried out, and any special codes or attribute values used, should be defined explicitly in the <segmentation> element of the <encodingDesc> within the associated TEI header.

6.2.80. *model.stageLike*

model.stageLike groups elements containing stage directions or similar things defined by the module for performance texts. [7.3. Other Types of Performance Text]

Module	tei
Used by	lg model.inter sp
Members	stage
Note	Stage directions are members of class <i>inter</i> : that is, they can appear between or within component-level elements.

6.2.81. *model.teiHeaderPart*

model.teiHeaderPart groups high level elements which may appear more than once in a TEI header.

Module	tei
Used by	teiHeader
Members	encodingDesc profileDesc xenoData

6.2.82. *model.titlepagePart*

model.titlepagePart groups elements which can occur as direct constituents of a title page, such as [<docTitle>](#), [<docAuthor>](#), [<docImprint>](#), or [<epigraph>](#). [4.6. Title Pages]

Module	tei
Used by	msItem
Members	argument binaryObject byline docDate epigraph graphic

6.3. Attribute classes

6.3.1. *att.ascribed*

att.ascribed provides attributes for elements representing speech or action that can be ascribed to a specific individual. [3.3.3. Quotation 8.3. Elements Unique to Spoken Texts]

Module	tei
Members	<code>att.ascribed.directed[kinesic q sp stage vocal] change</code>
Attributes	<p>Attributes</p> <p>who indicates the person, or group of people, to whom the element content is ascribed.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <code>teidata.pointer</code> separated by white-space</p> <p>In the following example from Hamlet, speeches (<code><sp></code>) in the body of the play are linked to <code><castItem></code> elements in the <code><castList></code> using the <code>who</code> attribute.</p> <pre> <castItem type="role"> <role xml:id="Barnardo">Bernardo</role> </castItem> <castItem type="role"> <role xml:id="Francisco">Francisco</role> <roleDesc>a soldier</roleDesc> </castItem> <!-- ... --> <sp who="#Barnardo"> <speaker>Bernardo</speaker> <l n="1">Who's there?</l> </sp> <sp who="#Francisco"> <speaker>Francisco</speaker> <l n="2">Nay, answer me: stand, and unfold yourself.</l> </sp> </pre> <p>Note For transcribed speech, this will typically identify a participant or participant group; in other contexts, it will point to any identified <code><person></code> element.</p>

6.3.2. `att.ascribed.directed`

att.ascribed.directed provides attributes for elements representing speech or action that can be directed at a group or individual. [3.3.3. Quotation 8.3. Elements Unique to Spoken Texts]

Module	tei
Members	<code>kinesic q sp stage vocal</code>
Attributes	<p>Attributes <code>att.ascribed (@who)</code></p> <p>toWhom indicates the person, or group of people, to whom a speech act or action is directed.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <code>teidata.pointer</code> separated by white-space</p> <p>In the following example from Mary Pix's The False Friend, speeches (<code><sp></code>) in the body of the play are linked to <code><castItem></code> elements in the <code><castList></code> using the <code>toWhom</code> attribute, which is used to specify who the speech is directed to. Additionally, the <code><stage></code> includes <code>toWhom</code> to indicate the directionality of the action.</p> <pre> <castItem type="role"> <role xml:id="emil">Emilius.</role> </castItem> <castItem type="role"> <role xml:id="lov">Lovisa</role> </castItem> <castItem type="role"> <role xml:id="serv">A servant</role> </castItem> <!-- ... --> <sp who="#emil" toWhom="#lov"> <speaker>Emil.</speaker> <l n="1">My love!</l> </sp> <sp who="#lov" toWhom="#emil"> <speaker>Lov.</speaker> <l n="2">I have no Witness of my Noble Birth</l> </pre>

```
<stage who="emil"
      toWhom="#serv">Pointing to her Woman.</stage>
<l>But that poor helpless wretch—</l>
</sp>
```

Note

To indicate the recipient of written correspondence, use the elements used in section 2.4.6. Correspondence Description, rather than a *toWhom* attribute.

6.3.3. *att.breaking*

att.breaking provides an attribute to indicate whether or not the element concerned is considered to mark the end of an orthographic token in the same way as whitespace. [3.10.3. Milestone Elements]											
Module	tei										
Members	cb gb lb milestone pb										
Attributes	<p>Attributes</p> <p>break indicates whether or not the element bearing this attribute should be considered to mark the end of an orthographic token in the same way as whitespace.</p> <table> <tr> <td>Status</td><td>Recommended</td></tr> <tr> <td>Datatype</td><td><u>teidata.enumerated</u></td></tr> <tr> <td>Sample values</td><td> yes the element bearing this attribute is considered to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace no the element bearing this attribute is considered not to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace maybe the encoding does not take any position on this issue. </td></tr> <tr> <td colspan="2"> In the following lines from the ‘Dream of the Rood’, linebreaks occur in the middle of the words <i>l#dost</i> and <i>reord-berendum</i>. </td></tr> <tr> <td colspan="2"> <pre><ab> ...e#esa tome iu ic#æs #e#orden #ita heardo#t . leodum la<lb break="no"/> ðost ærþan ichim lifes #e# rihtne #erymde reord be<lb break="no"/> rendum h#at me þa#e#eorðode #uldres ealdor ofer... </ab></pre> </td></tr> </table>	Status	Recommended	Datatype	<u>teidata.enumerated</u>	Sample values	yes the element bearing this attribute is considered to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace no the element bearing this attribute is considered not to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace maybe the encoding does not take any position on this issue. Status	Recommended										
Datatype	<u>teidata.enumerated</u>										
Sample values	yes the element bearing this attribute is considered to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace no the element bearing this attribute is considered not to mark the end of any adjacent orthographic token irrespective of the presence of any adjacent whitespace maybe the encoding does not take any position on this issue.										
In the following lines from the ‘Dream of the Rood’, linebreaks occur in the middle of the words <i>l#dost</i> and <i>reord-berendum</i> .											
<pre><ab> ...e#esa tome iu ic#æs #e#orden #ita heardo#t . leodum la<lb break="no"/> ðost ærþan ichim lifes #e# rihtne #erymde reord be<lb break="no"/> rendum h#at me þa#e#eorðode #uldres ealdor ofer... </ab></pre>											

6.3.4. *att.cReferencing*

att.cReferencing provides an attribute which may be used to supply a <i>canonical reference</i> as a means of identifying the target of a pointer.							
Module	tei						
Members	ptr ref term						
Attributes	<p>Attributes</p> <p>cRef (canonical reference) specifies the destination of the pointer by supplying a canonical reference expressed using the scheme defined in a <u><refs-Decl></u> element in the TEI header</p> <table> <tr> <td>Status</td><td>Optional</td></tr> <tr> <td>Datatype</td><td><u>teidata.text</u></td></tr> <tr> <td>Note</td><td>The value of <i>cRef</i> should be constructed so that when the algorithm for the resolution of canonical references (described in section 16.2.5. Canonical References) is applied to it the result is a valid URI reference to the intended target.</td></tr> </table>	Status	Optional	Datatype	<u>teidata.text</u>	Note	The value of <i>cRef</i> should be constructed so that when the algorithm for the resolution of canonical references (described in section 16.2.5. Canonical References) is applied to it the result is a valid URI reference to the intended target.
Status	Optional						
Datatype	<u>teidata.text</u>						
Note	The value of <i>cRef</i> should be constructed so that when the algorithm for the resolution of canonical references (described in section 16.2.5. Canonical References) is applied to it the result is a valid URI reference to the intended target.						

		The <code><refsDecl></code> to use may be indicated with the <code>decls</code> attribute. Currently these Guidelines only provide for a single canonical reference to be encoded on any given <code><ptr></code> element.
--	--	---

6.3.5. att.canonical

att.canonical provides attributes which can be used to associate a representation such as a name or title with canonical information about the object being named or referenced. [13.1.1. Linking Names and Their Referents]

Module	tei
Members	<pre>att.naming[att.personal[addName forename genName name objectName orgName persName placeName roleName surname] affiliation author birth bloc climate collection country death district editor education event geogFeat geogName institution nationality occupation offset origPlace population pubPlace region repository residence rs settlement socceStatus state terrain trait] authority correspDesc date distributor faith funder material object objectType principal publisher relation resp respStmt sponsor term time title</pre>
Attributes	<p>Attributes</p> <p>key provides an externally-defined means of identifying the entity (or entities) being named, using a coded value of some kind.</p> <p>Status Optional</p> <p>Datatype <code>teidata.text</code></p> <pre><author> <name key="name 427308" types="organisation">[New Zealand Parliament, Legislative Council]</name> </author> <author> <name key="Hugo, Victor (1802-1885)" ref="http://www.idref.fr/026927608">Victor Hugo</name> </author></pre> <p>Note The value may be a unique identifier from a database, or any other externally-defined string identifying the referent.</p> <p>No particular syntax is proposed for the values of the <code>key</code> attribute, since its form will depend entirely on practice within a given project. For the same reason, this attribute is not recommended in data interchange, since there is no way of ensuring that the values used by one project are distinct from those used by another. In such a situation, a preferable approach for magic tokens which follows standard practice on the Web is to use a <code>ref</code> attribute whose value is a tag URI as defined in RFC 4151.</p> <p>ref (reference) provides an explicit means of locating a full definition or identity for the entity being named by means of one or more URIs.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <code>teidata.pointer</code> separated by whitespace</p> <pre><name ref="http://viaf.org/viaf/109557338" type="person">Seamus Heaney</name></pre> <p>Note The value must point directly to one or more XML elements or other resources by means of one or more URIs, separated by whitespace. If more than one is supplied the implication is that the name identifies several distinct entities.</p>

6.3.6. att.citing

att.citing provides attributes for specifying the specific part of a bibliographic item being cited. [1.3.1. Attribute Classes]

Module	tei
Members	<code>biblScope citedRange</code>
Attributes	Attributes

	<p>unit identifies the unit of information conveyed by the element, e.g. columns, pages, volume, entry.</p> <p>Status Optional</p> <p>Datatype <u>teidata.enumerated</u></p> <p>Suggested values include:</p> <ul style="list-style-type: none"> vol- the element contains a volume number. is- the element contains an issue number, or volume and issue numbers. page the element contains a page number or page range. line the element contains a line number or line range. chap-ter the element contains a chapter indication (number and/or title) part the element identifies a part of a book or collection. col-umn the element identifies a column. en-try the element identifies an entry number or label in a list of entries.
	<p>from specifies the starting point of the range of units indicated by the <i>unit</i> attribute.</p> <p>Status Optional</p> <p>Datatype <u>teidata.word</u></p> <p>to specifies the end-point of the range of units indicated by the <i>unit</i> attribute.</p> <p>Status Optional</p> <p>Datatype <u>teidata.word</u></p>

6.3.7. *att.coordinated*

att.coordinated provides attributes which can be used to position their parent element within a two dimensional coordinate system.

Module	transcr														
Members	<u>surface zone</u>														
Attributes	<p>Attributes</p> <table> <tr> <td>start</td> <td>indicates the element within a transcription of the text containing at least the start of the writing represented by this zone or surface.</td> </tr> <tr> <td></td> <td>Status Optional</td> </tr> <tr> <td></td> <td>Datatype <u>teidata.pointer</u></td> </tr> <tr> <td>ulx</td> <td>gives the x coordinate value for the upper left corner of a rectangular space.</td> </tr> <tr> <td></td> <td>Status Optional</td> </tr> <tr> <td></td> <td>Datatype <u>teidata.numeric</u></td> </tr> <tr> <td>uly</td> <td>gives the y coordinate value for the upper left corner of a rectangular space.</td> </tr> </table>	start	indicates the element within a transcription of the text containing at least the start of the writing represented by this zone or surface.		Status Optional		Datatype <u>teidata.pointer</u>	ulx	gives the x coordinate value for the upper left corner of a rectangular space.		Status Optional		Datatype <u>teidata.numeric</u>	uly	gives the y coordinate value for the upper left corner of a rectangular space.
start	indicates the element within a transcription of the text containing at least the start of the writing represented by this zone or surface.														
	Status Optional														
	Datatype <u>teidata.pointer</u>														
ulx	gives the x coordinate value for the upper left corner of a rectangular space.														
	Status Optional														
	Datatype <u>teidata.numeric</u>														
uly	gives the y coordinate value for the upper left corner of a rectangular space.														

	<p>Status Optional</p> <p>Datatype teidata.numeric</p>
lrx	gives the x coordinate value for the lower right corner of a rectangular space.
	<p>Status Optional</p> <p>Datatype teidata.numeric</p>
lry	gives the y coordinate value for the lower right corner of a rectangular space.
	<p>Status Optional</p> <p>Datatype teidata.numeric</p>
points	identifies a two dimensional area within the bounding box specified by the other attributes by means of a series of pairs of numbers, each of which gives the x,y coordinates of a point on a line enclosing the area.
	<p>Status Optional</p> <p>Datatype 3-# occurrences of teidata.point separated by whitespace</p>

6.3.8. att.datable

att.datable provides attributes for normalization of elements that contain dates, times, or datable events. [3.5.4. Dates and Times 13.3.7. Dates and Times]

Module	tei
Members	acquisition affiliation age binding birth bloc change climate country creation date death district education event faith floruit geogFeat geogName idno langKnowledge langKnown licence location name nationality objectName occupation offset orgName origDate origPlace origin persName placeName population provenance region relation residence resp seal settlement sex socccStatus stamp state terrain time title trait
Attributes	<p>Attributes att.datable.w3c (@when, @notBefore, @notAfter, @from, @to) att.datable.iso (@when-iso, @notBefore-iso, @notAfter-iso, @from-iso, @to-iso) att.datable.custom (@when-custom, @notBefore-custom, @notAfter-custom, @from-custom, @to-custom, @datingPoint, @datingMethod)</p> <p>calendar indicates the system or calendar to which the date represented by the content of this element belongs.</p> <p>Status Optional</p> <p>Datatype teidata.pointer</p> <p>Schematron <sch:rule context="tei:*[@calendar]"> <sch:assert test="string-length(.) gt 0"> @calendar indicates the system or calendar to which the date represented by the content of this element belongs, but this <sch:name/> element has no textual content.</sch:assert> </sch:rule></p> <p style="background-color: #e0e0e0; padding: 5px;">He was born on <date calendar="#gregorian">Feb. 22, 1732</date> (<date when="1732-02-22"> Feb. 11, 1731/32, O.S.</date>).</p> <p>Note Note that the <i>calendar</i> attribute (unlike <i>datingMethod</i> defined in att.datable.custom) defines the calendar system of the date in the original material defined by the parent element, <i>not</i> the calendar to which the date is normalized.</p> <p>period supplies a pointer to some location defining a named period of time within which the datable item is understood to have occurred.</p> <p>Status Optional</p> <p>Datatype teidata.pointer</p>
Note	This ‘superclass’ provides attributes that can be used to provide normalized values of temporal information. By default, the attributes from the att.datable.w3c class are provided. If

the module for names & dates is loaded, this class also provides attributes from the `att.datable.iso` and `att.datable.custom` classes. In general, the possible values of attributes restricted to the W3C datatypes form a subset of those values available via the ISO 8601 standard. However, the greater expressiveness of the ISO datatypes may not be needed, and there exists much greater software support for the W3C datatypes.

6.3.9. `att.datable.custom`

`att.datable.custom` provides attributes for normalization of elements that contain datable events to a custom dating system (i.e. other than the Gregorian used by W3 and ISO). [13.3.7. Dates and Times]

Module	namesdates
Members	<code>att.datable[acquisition affiliation age binding birth bloc change climate country creation date death district education event faith floruit geogFeat geogName idno langKnowledge langKnown licence location name nationality objectName occupation offset orgName origDate origPlace origin persName placeName population provenance region relation residence resp seal settlement sex soccStatus stamp state terrain time title trait]</code>
Attributes	<p>Attributes</p> <p><code>when-custom</code> supplies the value of a date or time in some custom standard form.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <code>teidata.word</code> separated by whitespace</p> <p>The following are examples of custom date or time formats that are <i>not</i> valid ISO or W3C format normalizations, normalized to a different dating system</p> <pre><p>Alhazen died in Cairo on the <date when="1040-03-06" when-custom="431-06-12"> 12th day of Jumada t-Tania, 430 AH </date>.</p> <p>The current world will end at the <date when="2012-12-21" when-custom="13.0.0.0.0">end of B'ak'tun 13</date>.</p> <p>The Battle of Meggidu (<date when-custom="Thutmose_III:23">23rd year of reign of Thutmose III</date>).</p> <p>Esidorus bixit in pace annos LXX plus minus sub <date when-custom="Ind:4-10-11">die XI mensis Octobris indictione IIII</date> </p></pre> <p>Not all custom date formulations will have Gregorian equivalents. The <code>when-custom</code> attribute and other custom dating are not constrained to a datatype by the TEI, but individual projects are recommended to regularize and document their dating formats.</p> <p><code>notBefore-cus-</code> specifies the earliest possible date for the event in some custom standard form.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <code>teidata.word</code> separated by whitespace</p> <p><code>notAfter-cus-</code> specifies the latest possible date for the event in some custom standard form.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <code>teidata.word</code> separated by whitespace</p> <p><code>from-custom</code> indicates the starting point of the period in some custom standard form.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <code>teidata.word</code> separated by whitespace</p> <pre><event xml:id="FIRE1" datingMethod="#julian" from-custom="1666-09-02" to-custom="1666-09-05"> <head>The Great Fire of London</head> <p>The Great Fire of London burned through a large part of the city of London.</p> </event></pre> <p><code>to-custom</code> indicates the ending point of the period in some custom standard form.</p> <p>Status Optional</p>

	<p>Datatype 1–# occurrences of <code>teidata.word</code> separated by whitespace</p> <p>datingPoint supplies a pointer to some location defining a named point in time with reference to which the datable item is understood to have occurred</p> <p>Status Optional</p> <p>Datatype <code>teidata.pointer</code></p> <p>datingMethod supplies a pointer to a <code><calendar></code> element or other means of interpreting the values of the custom dating attributes.</p> <p>Status Optional</p> <p>Datatype <code>teidata.pointer</code></p> <pre style="background-color: #f0f0f0; padding: 5px;">Containing the Originall, Antiquity, Increa#e, Moderne estate, and de#cription of that Citie, written in the yeare <date when-custom="1598" calendar="#julian" datingMethod="#julian">1598</date>. by Iohn Stow Citizen of London.</pre> <p>In this example, the <code>calendar</code> attribute points to a <code><calendar></code> element for the Julian calendar, specifying that the text content of the <code><date></code> element is a Julian date, and the <code>datingMethod</code> attribute also points to the Julian calendar to indicate that the content of the <code>when-custom</code> attribute value is Julian too.</p> <pre style="background-color: #f0f0f0; padding: 5px;"><date when="1382-06-28" when-custom="6890-06-20" datingMethod="#creationOfWorld"> μ### ##### ## <num>#</num> ##### </date></pre> <p>In this example, a date is given in a Mediaeval text measured "from the creation of the world", which is normalised (in <code>when</code>) to the Gregorian date, but is also normalized (in <code>when-custom</code>) to a machine-actionable, numeric version of the date from the Creation.</p> <p>Note Note that the <code>datingMethod</code> attribute (unlike <code>calendar</code> defined in <code>att.datable</code>) defines the calendar or dating system to which the date described by the parent element is normalized (i.e. in the <code>when-custom</code> or other <code>X-custom</code> attributes), <i>not</i> the calendar of the original date in the element.</p>
--	---

6.3.10. `att.datable.iso`

`att.datable.iso` provides attributes for normalization of elements that contain datable events using the ISO 8601 standard.
[3.5.4. Dates and Times 13.3.7. Dates and Times]

Module	namesdates
Members	<code>att.datable[acquisition affiliation age binding birth bloc change climate country creation date death district education event faith floruit geogFeat geogName idno langKnowledge langKnown licence location name nationality objectName occupation offset orgName origDate origPlace origin persName placeName population provenance region relation residence resp seal settlement sex soccStatus stamp state terrain time title trait]</code>
Attributes	<p>Attributes</p> <p><code>when-iso</code> supplies the value of a date or time in a standard form.</p> <p>Status Optional</p> <p>Datatype <code>teidata.temporal.iso</code></p> <p>The following are examples of ISO date, time, and date & time formats that are <i>not</i> valid W3C format normalizations.</p> <pre style="background-color: #f0f0f0; padding: 5px;"><date when-iso="1996-09-24T07:25+00">Sept. 24th, 1996 at 3:25 in the morning</date> <date when-iso="1996-09-24T03:25-04">Sept. 24th, 1996 at 3:25 in the morning</date> <time when-iso="1999-01-04T20:42-05">4 Jan 1999 at 8:42 pm</time> <time when-iso="1999-W01-1720,70-05">4 Jan 1999 at 8:42 pm</time> <date when-iso="2006-05-18T10:03">a few minutes after ten in the morning on Thu 18 May</date> <time when-iso="03:00">3 A.M.</time> <time when-iso="14">around two</time> <time when-iso="15,5">half past three</time></pre>

	<p>All of the examples of the <i>when</i> attribute in the <code>att.datable.w3c</code> class are also valid with respect to this attribute.</p> <pre>He likes to be punctual. I said <q> <time when-iso="12">around noon</time> </q>, and he showed up at <time when-iso="12:00:00">12 O'clock</time> on the dot.</pre> <p>The second occurrence of <code><time></code> could have been encoded with the <i>when</i> attribute, as 12:00:00 is a valid time with respect to the W3C <i>XML Schema Part 2: Datatypes Second Edition</i> specification. The first occurrence could not.</p>
notBefore-iso	<p>specifies the earliest possible date for the event in standard form, e.g. yyyy-mm-dd.</p> <p>Status Optional Datatype teidata.temporal.iso</p>
notAfter-iso	<p>specifies the latest possible date for the event in standard form, e.g. yyyy-mm-dd.</p> <p>Status Optional Datatype teidata.temporal.iso</p>
from-iso	<p>indicates the starting point of the period in standard form.</p> <p>Status Optional Datatype teidata.temporal.iso</p>
to-iso	<p>indicates the ending point of the period in standard form.</p> <p>Status Optional Datatype teidata.temporal.iso</p>
Note	<p>The value of these attributes should be a normalized representation of the date, time, or combined date & time intended, in any of the standard formats specified by ISO 8601, using the Gregorian calendar.</p>
Note	<p>If both <i>when-iso</i> and <i>dur-iso</i> are specified, the values should be interpreted as indicating a span of time by its starting time (or date) and duration. That is,</p> <pre><date when-iso="2007-06-01" dur-iso="P8D"/></pre> <p>indicates the same time period as</p> <pre><date when-iso="2007-06-01/P8D"/></pre> <p>In providing a ‘regularized’ form, no claim is made that the form in the source text is incorrect; the regularized form is simply that chosen as the main form for purposes of unifying variant forms under a single heading.</p>

6.3.11. `att.datable.w3c`

`att.datable.w3c` provides attributes for normalization of elements that contain datable events conforming to the W3C *XML Schema Part 2: Datatypes Second Edition*. [3.5.4. Dates and Times 13.3.7. Dates and Times]

Module	tei

Schematron	<pre><sch:rule context="tei:*[@to]"> <sch:report test="@notAfter" role="nonfatal">The @to and @notAfter attributes cannot be used together.</sch:report> </sch:rule></pre>
Example	<pre><date from="1863-05-28" to="1863-06-01">28 May through 1 June 1863</date></pre>
Note	<p>The value of these attributes should be a normalized representation of the date, time, or combined date & time intended, in any of the standard formats specified by <i>XML Schema Part 2: Datatypes Second Edition</i>, using the Gregorian calendar.</p> <p>The most commonly-encountered format for the date portion of a temporal attribute is yyyy-mm-dd, but yyyy, --mm, ---dd, yyyy-mm, or --mm-dd may also be used. For the time part, the form hh:mm:ss is used.</p> <p>Note that this format does not currently permit use of the value 0000 to represent the year 1 BCE; instead the value -0001 should be used.</p>

6.3.12. att.datcat

att.datcat provides the *dcr:datatype* and *dcr:ValueDatatype* attributes which are used to align XML elements or attributes with the appropriate Data Categories (DCs) defined by the ISO 12620:2009 standard and stored in the Web repository called ISOCat at <http://www.isocat.org/>. [9.5.2. Lexical View 18.3. Other Atomic Feature Values]

Module	tei
--------	-----

Members	<u>att.segLike[pc seg]</u>
Attributes	<p>Attributes</p> <p>datcat contains a PID (persistent identifier) that aligns the given element with the appropriate Data Category (or categories) in ISOcat.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <u>teidata.pointer</u> separated by white-space</p> <p>valueDatcat contains a PID (persistent identifier) that aligns the content of the given element or the value of the given attribute with the appropriate simple Data Category (or categories) in ISOcat.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <u>teidata.pointer</u> separated by white-space</p>
Example	In this example <i>dcr:datcat</i> relates the feature name to the data category "partOfSpeech" and <i>dcr:valueDatcat</i> the feature value to the data category "commonNoun". Both these data categories reside in the ISOcat DCR at www.isocat.org , which is the DCR used by ISO TC37 and hosted by its registration authority, the MPI for Psycholinguistics in Nijmegen. <pre><fs xmlns:dcr="http://www.isocat.org/ns/dcr"> <f name="POS" dcr:datcat="http://www.isocat.org/datcat/DC-1345" fVal="#commonNoun" dcr:valueDatcat="http://www.isocat.org/datcat/DC-1256"/> </fs></pre>
Note	ISO 12620:2009 is a standard describing the data model and procedures for a Data Category Registry (DCR). Data categories are defined as elementary descriptors in a linguistic structure. In the DCR data model each data category gets assigned a unique Persistent IDentifier (PID), i.e., an URI. Linguistic resources or preferably their schemas that make use of data categories from a DCR should refer to them using this PID. For XML-based resources, like TEI documents, ISO 12620:2009 normative Annex A gives a small Data Category Reference XML vocabulary (also available online at http://www.isocat.org/12620/), which provides two attributes, <i>dcr:datcat</i> and <i>dcr:valueDatcat</i> .

6.3.13. att.declarable

att.declarable provides attributes for those elements in the TEI header which may be independently selected by means of the special purpose *decls* attribute. [15.3. Associating Contextual Information with a Text]

Module	tei
Members	<u>availability</u> <u>bibl</u> <u>biblFull</u> <u>biblStruct</u> <u>correction</u> <u>correspDesc</u> <u>editorialDecl</u> <u>geoDecl</u> <u>hyphenation</u> <u>interpretation</u> <u>langUsage</u> <u>listBibl</u> <u>listEvent</u> <u>listNym</u> <u>listObject</u> <u>listOrg</u> <u>listPerson</u> <u>listPlace</u> <u>normalization</u> <u>projectDesc</u> <u>punctuation</u> <u>quotation</u> <u>refsDecl</u> <u>segmentation</u> <u>sourceDesc</u> <u>stdVals</u> <u>textClass</u> <u>xenoData</u>
Attributes	<p>Attributes</p> <p>default indicates whether or not this element is selected by default when its parent is selected.</p> <p>Status Optional</p> <p>Datatype <u>teidata.truthValue</u></p> <p>Legal values true are: This element is selected if its parent is selected false This element can only be selected explicitly, unless it is the only one of its kind, in which case it is selected if its parent is selected.[Default]</p>
Note	The rules governing the association of declarable elements with individual parts of a TEI text are fully defined in chapter 15.3. Associating Contextual Information with a Text. Only one element of a particular type may have a <i>default</i> attribute with a value of true.

6.3.14. att.declaring

<p>att.declaring provides attributes for elements which may be independently associated with a particular declarable element within the header, thus overriding the inherited default for that element. [15.3. Associating Contextual Information with a Text]</p>	
Module	tei
Members	<u>ab</u> <u>back</u> <u>body</u> <u>div</u> <u>facsimile</u> <u>floatingText</u> <u>front</u> <u>geo</u> <u>graphic</u> <u>lg</u> <u>media</u> <u>msDesc</u> <u>object</u> <u>p</u> <u>ptr</u> <u>ref</u> <u>surface</u> <u>term</u> <u>text</u>
Attributes	<p>Attributes</p> <p>decls identifies one or more <i>declarable elements</i> within the header, which are understood to apply to the element bearing this attribute and its content.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <u>teidata.pointer</u> separated by white-space</p>
Note	The rules governing the association of declarable elements with individual parts of a TEI text are fully defined in chapter 15.3. Associating Contextual Information with a Text.

6.3.15. att.dimensions

<p>att.dimensions provides attributes for describing the size of physical objects.</p>	
Module	tei
Members	<u>add</u> <u>addSpan</u> <u>age</u> <u>birth</u> <u>date</u> <u>death</u> <u>del</u> <u>delSpan</u> <u>dimensions</u> <u>floruit</u> <u>gap</u> <u>geogFeat</u> <u>height</u> <u>offset</u> <u>origDate</u> <u>population</u> <u>space</u> <u>state</u> <u>subst</u> <u>supplied</u> <u>time</u> <u>trait</u> <u>unclear</u> <u>width</u>
Attributes	<p>Attributes <u>att.ranging</u> (@atLeast, @atMost, @min, @max, @confidence)</p> <p>unit names the unit used for the measurement</p> <p>Status Optional</p> <p>Datatype <u>teidata.enumerated</u></p> <p>Suggested values include:</p> <ul style="list-style-type: none"> cm (centimetres) mm (millimetres) in (inches) line lines of text char (characters) characters of text <p>quantity specifies the length in the units specified</p> <p>Status Optional</p> <p>Datatype <u>teidata.numeric</u></p> <p>extent indicates the size of the object concerned using a project-specific vocabulary combining quantity and units in a single string of words.</p> <p>Status Optional</p> <p>Datatype <u>teidata.text</u></p> <pre><gap extent="5 words"/> <height extent="half the page"/></pre> <p>precision characterizes the precision of the values specified by the other attributes.</p> <p>Status Optional</p> <p>Datatype <u>teidata.certainty</u></p>

	scope	<p>where the measurement summarizes more than one observation, specifies the applicability of this measurement.</p> <p>Status Optional</p> <p>Datatype <u>teidata.enumerated</u></p> <p>Sample values include: all measurement applies to all instances. most measurement applies to most of the instances inspected. range measurement applies to only the specified range of instances.</p>
--	-------	--

6.3.16. att.divLike

<p>att.divLike provides attributes common to all elements which behave in the same way as divisions. [4. Default Text Structure]</p>	
Module	tei
Members	div lg
Attributes	<p>Attributes <u>att.fragmentable</u> (@part)</p> <p>org (organization) specifies how the content of the division is organized. Status Optional Datatype <u>teidata.enumerated</u></p> <p>Legal values com- are: pos- no claim is made about the sequence in which ite the immediate contents of this division are to be processed, or their inter-relationships.</p> <p>uni- formthe immediate contents of this element are re- garded as forming a logical unit, to be processed in sequence.[Default]</p> <p>sample indicates whether this division is a sample of the original source and if so, from which part. Status Optional Datatype <u>teidata.enumerated</u></p> <p>Legal values ini- are: tial division lacks material present at end in source. me- di- division lacks material at start and end. al fi- nal division lacks material at start. un- knowposition of sampled material within original un- known. com- pleteddivision is not a sample.[Default]</p>

6.3.17. att.docStatus

<p>att.docStatus provides attributes for use on metadata elements describing the status of a document.</p>	
Module	tei

Members	<u>bibl</u> <u>biblFull</u> <u>biblStruct</u> <u>change</u> <u>msDesc</u> <u>object</u> <u>revisionDesc</u>						
Attributes	<p>Attributes</p> <p>status describes the status of a document either currently or, when associated with a dated element, at the time indicated.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td><code>teidata.enumerated</code></td> </tr> <tr> <td>Sample values include:</td> <td>ap- proved can- di- date cleared dep- re- cat- ed draft [Default] em- bar- goed ex- pired frozen gal- ley pro- posed pub- lished rec- om- men- da- tion sub- mit- ted un- fin- ished with- drawn</td> </tr> </table>	Status	Optional	Datatype	<code>teidata.enumerated</code>	Sample values include:	ap- proved can- di- date cleared dep- re- cat- ed draft [Default] em- bar- goed ex- pired frozen gal- ley pro- posed pub- lished rec- om- men- da- tion sub- mit- ted un- fin- ished with- drawn
Status	Optional						
Datatype	<code>teidata.enumerated</code>						
Sample values include:	ap- proved can- di- date cleared dep- re- cat- ed draft [Default] em- bar- goed ex- pired frozen gal- ley pro- posed pub- lished rec- om- men- da- tion sub- mit- ted un- fin- ished with- drawn						
Example	<pre><revisionDesc status="published"> <change when="2010-10-21" status="published"/> <change when="2010-10-02" status="cleared"/> <change when="2010-08-02" status="embargoed"/> <change when="2010-05-01" status="frozen" who="#MSM"/> <change when="2010-03-01" status="draft" who="#LB"/> </revisionDesc></pre>						

6.3.18. att.duration

att.duration provides attributes for normalization of elements that contain datable events.	
Module	spoken
Members	<u>att.timed</u> [<u>binaryObject</u> <u>gap</u> <u>kinesic</u> <u>media</u> <u>vocal</u>] <u>date</u> <u>time</u>
Attributes	Attributes <u>att.duration.w3c</u> (@dur) <u>att.duration.iso</u> (@dur-iso)
Note	This ‘superclass’ provides attributes that can be used to provide normalized values of temporal information. By default, the attributes from the <u>att.duration.w3c</u> class are provided. If the module for names & dates is loaded, this class also provides attributes from the <u>att.duration.iso</u> class. In general, the possible values of attributes restricted to the W3C datatypes form a subset of those values available via the ISO 8601 standard. However, the greater expressiveness of the ISO datatypes is rarely needed, and there exists much greater software support for the W3C datatypes.

6.3.19. att.duration.iso

att.duration.iso provides attributes for recording normalized temporal durations. [3.5.4. Dates and Times 13.3.7. Dates and Times]	
Module	tei
Members	<u>att.duration</u> [<u>att.timed</u> [<u>binaryObject</u> <u>gap</u> <u>kinesic</u> <u>media</u> <u>vocal</u>] <u>date</u> <u>time</u>]
Attributes	Attributes <u>dur-iso</u> (duration) indicates the length of this element in time. Status Optional Datatype <u>teidata.duration.iso</u>
Note	If both <i>when</i> and <i>dur</i> or <i>dur-iso</i> are specified, the values should be interpreted as indicating a span of time by its starting time (or date) and duration. In order to represent a time range by a duration and its ending time the <i>when-iso</i> attribute must be used. In providing a ‘regularized’ form, no claim is made that the form in the source text is incorrect; the regularized form is simply that chosen as the main form for purposes of unifying variant forms under a single heading.

6.3.20. att.duration.w3c

att.duration.w3c provides attributes for recording normalized temporal durations. [3.5.4. Dates and Times 13.3.7. Dates and Times]	
Module	tei
Members	<u>att.duration</u> [<u>att.timed</u> [<u>binaryObject</u> <u>gap</u> <u>kinesic</u> <u>media</u> <u>vocal</u>] <u>date</u> <u>time</u>]
Attributes	Attributes <u>dur</u> (duration) indicates the length of this element in time. Status Optional Datatype <u>teidata.duration.w3c</u>
Note	If both <i>when</i> and <i>dur</i> are specified, the values should be interpreted as indicating a span of time by its starting time (or date) and duration. In order to represent a time range by a duration and its ending time the <i>when-iso</i> attribute must be used. In providing a ‘regularized’ form, no claim is made that the form in the source text is incorrect; the regularized form is simply that chosen as the main form for purposes of unifying variant forms under a single heading.

6.3.21. att.editLike

att.editLike provides attributes describing the nature of an encoded scholarly intervention or interpretation of any kind. [3.4. Simple Editorial Changes 10.3.1. Origination 13.3.2. The Person Element 11.3.1.1. Core Elements for Transcriptional Work]	
Module	tei
Members	<u>att.transcriptional</u> [<u>add</u> <u>addSpan</u> <u>del</u> <u>delSpan</u> <u>subst</u>] <u>affiliation</u> <u>age</u> <u>birth</u> <u>climate</u> <u>corr</u> <u>date</u> <u>death</u> <u>education</u> <u>event</u> <u>expan</u> <u>faith</u> <u>floruit</u> <u>gap</u> <u>geogFeat</u> <u>geogName</u> <u>langKnowledge</u> <u>langKnown</u> <u>location</u> <u>name</u> <u>nationality</u> <u>objectName</u> <u>occupation</u> <u>offset</u> <u>org</u> <u>orgName</u> <u>origDate</u> <u>orig-</u>

	<u>Place</u> <u>origin</u> <u>persName</u> <u>person</u> <u>persona</u> <u>place</u> <u>placeName</u> <u>population</u> <u>reg</u> <u>relation</u> <u>residence</u> <u>sex</u> <u>socecStatus</u> <u>state</u> <u>supplied</u> <u>terrain</u> <u>time</u> <u>trait</u> <u>unclear</u>
Attributes	<p>Attributes</p> <p>evidence indicates the nature of the evidence supporting the reliability or accuracy of the intervention or interpretation.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <u>teidata.enumerated</u> separated by whitespace</p> <p>Suggested values include:</p> <ul style="list-style-type: none"> in- ter- there is internal evidence to support the intervention. ex- ter- there is external evidence to support the intervention. con- jec- the intervention or interpretation has been made ture by the editor, cataloguer, or scholar on the basis of their expertise. <p>instant indicates whether this is an instant revision or not.</p> <p>Status Optional</p> <p>Datatype <u>teidata.xTruthValue</u></p> <p>Default false</p>
Note	The members of this attribute class are typically used to represent any kind of editorial intervention in a text, for example a correction or interpretation, or to date or localize manuscripts etc.
Note	Each pointer on the <i>source</i> (if present) corresponding to a witness or witness group should reference a bibliographic citation such as a <u><witness></u> , <u><msDesc></u> , or <u><bibl></u> element, or another external bibliographic citation, documenting the source concerned.

6.3.22. *att.edition*

	att.edition provides attributes identifying the source edition from which some encoded feature derives.
Module	tei
Members	<u>cb</u> <u>gb</u> <u>lb</u> <u>milestone</u> <u>pb</u> <u>refState</u>
Attributes	<p>Attributes</p> <p>ed (edition) supplies a sigil or other arbitrary identifier for the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <u>teidata.word</u> separated by whitespace</p> <p>edRef (edition reference) provides a pointer to the source edition in which the associated feature (for example, a page, column, or line break) occurs at this point in the text.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <u>teidata.pointer</u> separated by whitespace</p>
Example	<pre><l>Of Mans First Disobedience,<lb ed="1674"/> and<lb ed="1667"/> the Fruit</l> <l>of that Forbidden Tree, whose<lb ed="1667 1674"/> mortal tast</l> <l>Brought Death into the World,<lb ed="1667"/> and all<lb ed="1674"/> our woe,</l></pre>
Example	<pre><listBibl> <bibl xml:id="stapledon1937"> <author>Olaf Stapledon</author>, <title>Starmaker</title>, <publisher>Methuen</publisher>, <date>1937</date> </bibl> <bibl xml:id="stapledon1968"></pre>

```

<author>Olaf Stapledon</author>,
<title>Starmaker</title>, <publisher>Dover</publisher>, <date>1968</date>
</bibl>
</listBibl>
<!-- ... -->
<p>Looking into the future aeons from the supreme moment of
the cosmos, I saw the populations still with all their
strength maintaining the<pb n="411" edRef="#stapledon1968"/>essentials of their ancient culture,
still living their personal lives in zest and endless
novelty of action, ... I saw myself still
preserving, though with increasing difficulty, my lucid
con-<pb n="291" edRef="#stapledon1937"/>sciousness;</p>

```

6.3.23. *att.fragmentable*

att.fragmentable provides an attribute for representing fragmentation of a structural element, typically as a consequence of some overlapping hierarchy.

Module	tei				
Members	<u>att.divLike[div lg]</u> <u>att.segLike[pc seg]</u> <u>ab l p</u>				
Attributes	<p>Attributes</p> <p>part specifies whether or not its parent element is fragmented in some way, typically by some other overlapping structure: for example a speech which is divided between two or more verse stanzas, a paragraph which is split across a page division, a verse line which is divided between two speakers.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td><u>teidata.enumerated</u></td> </tr> </table> <p>Legal values Y</p> <p>are: (yes) the element is fragmented in some (unspecified) respect</p> <p>N (no) the element is not fragmented, or no claim is made as to its completeness[Default]</p> <p>I (initial) this is the initial part of a fragmented element</p> <p>M (medial) this is a medial part of a fragmented element</p> <p>F (final) this is the final part of a fragmented element</p> <p>Note The values I, M, or F should be used only where it is clear how the element may be reconstituted.</p>	Status	Optional	Datatype	<u>teidata.enumerated</u>
Status	Optional				
Datatype	<u>teidata.enumerated</u>				

6.3.24. *att.global*

att.global provides attributes common to all elements in the TEI encoding scheme. [1.3.1.1. Global Attributes]

Module	tei
Members	<u>TEI</u> <u>ab</u> <u>abbr</u> <u>abstract</u> <u>accMat</u> <u>acquisition</u> <u>add</u> <u>addName</u> <u>addSpan</u> <u>additional</u> <u>additions</u> <u>addr</u> <u>Line</u> <u>address</u> <u>affiliation</u> <u>age</u> <u>altIdentifier</u> <u>analytic</u> <u>anchor</u> <u>argument</u> <u>author</u> <u>authority</u> <u>availability</u> <u>back</u> <u>bibl</u> <u>biblFull</u> <u>biblScope</u> <u>biblStruct</u> <u>binaryObject</u> <u>binding</u> <u>bindingDesc</u> <u>birth</u> <u>bloc</u> <u>body</u> <u>byline</u> <u>calendar</u> <u>calendarDesc</u> <u>castItem</u> <u>castList</u> <u>catRef</u> <u>catchwords</u> <u>cb</u> <u>cell</u> <u>change</u> <u>choice</u> <u>citedRange</u> <u>climate</u> <u>closer</u> <u>collation</u> <u>collection</u> <u>condition</u> <u>corr</u> <u>correction</u> <u>correspAction</u> <u>correspContext</u> <u>correspDesc</u> <u>country</u> <u>creation</u> <u>date</u> <u>dateline</u> <u>death</u> <u>decoDesc</u> <u>decoNote</u> <u>delSpan</u> <u>desc</u> <u>dimensions</u> <u>distinct</u> <u>distributor</u> <u>district</u> <u>div</u> <u>divGen</u> <u>docDate</u> <u>edition</u> <u>editionStmt</u> <u>editor</u> <u>editorialDecl</u> <u>education</u> <u>emph</u> <u>encodingDesc</u> <u>epigraph</u> <u>event</u> <u>expan</u> <u>explicit</u> <u>extent</u> <u>facsimile</u> <u>faith</u> <u>figDesc</u> <u>figure</u> <u>fileDesc</u> <u>floatingText</u> <u>floruit</u> <u>foliation</u> <u>foreign</u> <u>forename</u> <u>front</u> <u>fund</u> <u>fw</u> <u>g</u> <u>gap</u> <u>gb</u> <u>genName</u> <u>geo</u> <u>geoDecl</u> <u>geogFeat</u> <u>geogName</u> <u>graphic</u> <u>handDesc</u> <u>handNote</u> <u>handNotes</u> <u>handShift</u> <u>head</u> <u>height</u> <u>hi</u> <u>history</u> <u>hyphenation</u> <u>idno</u> <u>imprint</u> <u>index</u> <u>institution</u> <u>in-</u>

Reference Systems.	Status	Optional	Datatype	<u>teidata.text</u>	Note	The value of this attribute is always understood to be a single token, even if it contains space or other punctuation characters, and need not be composed of numbers only. It is typically used to specify the numbering of chapters, sections, list items, etc.; it may also be used in the specification of a standard reference system for the text.	Status	Optional	Datatype	<u>teidata.language</u>	Note	<pre><p> ... The consequences of this rapid depopulation were the loss of the last <foreign xml:lang="rap">zariki</foreign> or chief (Routledge 1920:205,210) and their connections to ancestral territorial organization.</p></pre>	Note	The <i>xml:lang</i> value will be inherited from the immediately enclosing element, or from its parent, and so on up the document hierarchy. It is generally good practice to specify <i>xml:lang</i> at the highest appropriate level, noticing that a different default may be needed for the <i>teiHeader</i> from that needed for the associated resource element or elements, and that a single TEI document may contain texts in many languages.		The authoritative list of registered language subtags is maintained by IANA and is available at http://www.iana.org/assignments/language-subtag-registry . For a good general overview of the construction of language tags, see http://www.w3.org/International/articles/lang-registers.html .
Status	Optional																						
Datatype	ID																						
Note	The <i>xml:id</i> attribute may be used to specify a canonical reference for an element; see section 3.10. Reference Systems.																						
Status	Optional																						
Datatype	<u>teidata.text</u>																						
Note	The value of this attribute is always understood to be a single token, even if it contains space or other punctuation characters, and need not be composed of numbers only. It is typically used to specify the numbering of chapters, sections, list items, etc.; it may also be used in the specification of a standard reference system for the text.																						
Status	Optional																						
Datatype	<u>teidata.language</u>																						
Note	<pre><p> ... The consequences of this rapid depopulation were the loss of the last <foreign xml:lang="rap">zariki</foreign> or chief (Routledge 1920:205,210) and their connections to ancestral territorial organization.</p></pre>																						
Note	The <i>xml:lang</i> value will be inherited from the immediately enclosing element, or from its parent, and so on up the document hierarchy. It is generally good practice to specify <i>xml:lang</i> at the highest appropriate level, noticing that a different default may be needed for the <i>teiHeader</i> from that needed for the associated resource element or elements, and that a single TEI document may contain texts in many languages.																						
	The authoritative list of registered language subtags is maintained by IANA and is available at http://www.iana.org/assignments/language-subtag-registry . For a good general overview of the construction of language tags, see http://www.w3.org/International/articles/lang-registers.html .																						

		<p>guage-tags/, and for a practical step-by-step guide, see https://www.w3.org/International/questions/qa-choosing-language-tags.en.php.</p> <p>The value used must conform with BCP 47. If the value is a private use code (i.e., starts with x- or contains -x-), a <code><language></code> element with a matching value for its <code>ident</code> attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their IETFIInternet Engineering Task Force definitions.</p>
xml:base		<p>provides a base URI reference with which applications can resolve relative URI references into absolute URI references.</p> <p>Status Optional</p> <p>Datatype teidata.pointer</p> <pre><div type="bibl"> <head>bibliography</head> <listBibl xml:base="http://www.lib.ucdavis.edu/BWRP/Works/"> <bibl> <author> <name>Landon, Letitia Elizabeth</name> </author> <ref target="LandLVowOf.sgm"> <title>The Vow of the Peacock</title> </ref> </bibl> <bibl> <author> <name>Compton, Margaret Clephane</name> </author> <ref target="NortMIrene.sgm"> <title>Irene, a Poem in Six Cantos</title> </ref> </bibl> <bibl> <author> <name>Taylor, Jane</name> </author> <ref target="TaylJEssay.sgm"> <title>Essays in Rhyme on Morals and Manners</title> </ref> </bibl> </listBibl> </div></pre>
xml:space		<p>signals an intention about how white space should be managed by applications.</p> <p>Status Optional</p> <p>Datatype teidata.enumerated</p> <p>Legal values <code>de-</code> are: <code>fault</code>signals that the application's default white-space processing modes are acceptable <code>pre-</code> <code>serv</code>indicates the intent that applications preserve all white space</p> <p>Note The XML specification provides further guidance on the use of this attribute. Note that many parsers may not handle <code>xml:space</code> correctly.</p>

6.3.25. `att.global.analytic`

`att.global.analytic` provides additional global attributes for associating specific analyses or interpretations with appropriate portions of a text. [17.2. Global Attributes for Simple Analyses 17.3. Spans and Interpretations]

Module	analysis
Members	<code>att.global[TEI ab abbr abstract accMat acquisition add addName addSpan additional additions addrLine address affiliation age altIdentifier analytic anchor argument author authority availability back bibl biblFull biblScope biblStruct binaryObject binding bindingDesc birth bloc body byline calendar calendarDesc castItem castList catRef catchwords cb cell change choice cit citedRange climate closer collation collection condition corr correction</code>

Attributes	<p>Attributes</p> <p>corresp (corresponds) points to elements that correspond to the current element in some way.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>1–# occurrences of <code>teidata.pointer</code> separated by whitespace</td> </tr> </table> <pre><group> <text xml:id="t1-g1-t1" xml:lang="mi"> <body xml:id="t1-g1-t1-body1"> <div type="chapter"> <head>He Whakamaratanga mo te Ture Hoko, Riihi hoki, i nga Whenua Maori, 1876.</head> <p>...</p> </div> </body> </text> <text xml:id="t1-g1-t2" xml:lang="en"> <body xml:id="t1-g1-t2-body1" corresp="#t1-g1-t1-body1"> <div type="chapter"> <head>An Act to regulate the Sale, Letting, and Disposal of Native Lands, 1876.</head> <p>...</p> </div> </body> </text> </group></pre> <p>In this example a <code><group></code> contains two <code><text></code>s, each containing the same document in a different language. The correspondence is indicated using <code>corresp</code>. The language is indicated using <code>xml:lang</code>, whose value is inherited; both the tag with the <code>corresp</code> and the tag pointed to by the <code>corresp</code> inherit the value from their immediate parent.</p> <pre><!-- In a placeography called "places.xml" --><place xml:id="LOND1" corresp="people.xml#LOND2 people.xml#GEN11"> <placeName>London</placeName> <desc>The city of London...</desc> </place></pre>	Status	Optional	Datatype	1–# occurrences of <code>teidata.pointer</code> separated by whitespace
Status	Optional				
Datatype	1–# occurrences of <code>teidata.pointer</code> separated by whitespace				

```

<!-- In a literary personography called "people.xml" -->
<person xml:id="LOND2"
       corresp="places.xml#LOND1 #GENI1">
  <persName type="lit">London</persName>
  <note>
    <p>Allegorical character representing the city of <placeName ref="places.xml#LOND1">London</placeName>
  </note>
<person xml:id="GENI1"
       corresp="places.xml#LOND1 #LOND2">
  <persName type="lit">London's Genius</persName>
  <note>
    <p>Personification of London's genius. Appears as an
       allegorical character in mayoral shows.
  </p>
  </note>
</person>

```

In this example, a `<place>` element containing information about the city of London is linked with two `<person>` elements in a literary personography. This correspondence represents a slightly looser relationship than the one in the preceding example; there is no sense in which an allegorical character could be substituted for the physical city, or vice versa, but there is obviously a correspondence between them.

synch	<p>(synchronous) points to elements that are synchronous with the current element.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <code>teidata.pointer</code> separated by white-space</p>
sameAs	<p>points to an element that is the same as the current element.</p> <p>Status Optional</p> <p>Datatype <code>teidata.pointer</code></p>
copyOf	<p>points to an element of which the current element is a copy.</p> <p>Status Optional</p> <p>Datatype <code>teidata.pointer</code></p> <p>Note Any content of the current element should be ignored. Its true content is that of the element being pointed at.</p>
next	<p>points to the next element of a virtual aggregate of which the current element is part.</p> <p>Status Optional</p> <p>Datatype <code>teidata.pointer</code></p> <p>Note It is recommended that the element indicated be of the same type as the element bearing this attribute.</p>
prev	<p>(previous) points to the previous element of a virtual aggregate of which the current element is part.</p> <p>Status Optional</p> <p>Datatype <code>teidata.pointer</code></p> <p>Note It is recommended that the element indicated be of the same type as the element bearing this attribute.</p>
exclude	<p>points to elements that are in exclusive alternation with the current element.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <code>teidata.pointer</code> separated by white-space</p>
select	<p>selects one or more alternants; if one alternant is selected, the ambiguity or uncertainty is marked as resolved. If more than one alternant is selected, the degree of ambiguity or uncertainty is marked as reduced by the number of alternants not selected.</p>

	<p>Status Optional</p> <p>Datatype 1–# occurrences of <code>teidata.pointer</code> separated by whitespace</p> <p>Note This attribute should be placed on an element which is superordinate to all of the alternants from which the selection is being made.</p>
--	---

6.3.29. `att.global.rendition`

`att.global.rendition` provides rendering attributes common to all elements in the TEI encoding scheme. [1.3.1.1.3. Rendition Indicators]

Module	tei								
Members	<code>att.global[TEI ab abbr abstract accMat acquisition add addName addSpan additional additions addrLine address affiliation age altIdentifier analytic anchor argument author authority availability back bibl biblFull biblScope biblStruct binaryObject binding bindingDesc birth bloc body byline calendar calendarDesc castItem castList catRef catchwords cb cell change choice cit citedRange climate closer collation collection condition corr correction correspAction correspContext correspDesc country creation date dateline death decoDesc decoNote delSpan desc dimensions distinct distributor district div divGen docDate edition editionStmt editor editorialDecl education emph encodingDesc epigraph event expand explicit extent facsimile faith figDesc figure fileDesc floatingText floruit foliation foreign forename front funder fw g gap gb genName geo geoDecl geogFeat geogName graphic handDesc handNote handNotes handShift head height hi history hyphenation idno imprint index institution interpretation item keywords kinesic l label langKnowledge langKnown langUsage language layout layoutDesc lb lg licence link linkGrp list listBibl listEvent listNym listObject listOrg listPerson listPlace listRelation listTranspose location material measure measureGrp media mentioned metemark milestone monogr msContents msDesc msIdentifier msItem msItemStruct msName name nameLink namespace nationality normalization note notesStmt num nym object objectDesc objectIdentifier objectName objectType occupation offset opener org orgName orig origDate origPlace origin p pb pc persName person personGrp persona physDesc place placeName population postCode postscript prefixDef principal profileDesc projectDesc provenance ptr pubPlace publicationStmt publisher punctuation q quotation quote ref refState refsDecl reg region relatedItem relation rendition repository residence resp respStmt revisionDesc role roleDesc roleName row rs salute schemaRef seal sealDesc seg segmentation series seriesStmt settlement sex sic signed soCalled socieStatus source sourceDesc sp speaker sponsor stage stamp state stdVals street subst summary supplied support supportDesc surface surname table teiCorpus teiHeader term terrain text textClass textLang time title titleStmt trailer trait transpose unclear unit vocal watermark width xenoData zone]</code>

6.3.31. att.global.source

att.global.source provides an attribute used by elements to point to an external source. [1.3.1.1.4. Sources, certainty, and responsibility 3.3.3. Quotation 8.3.4. Writing]

Module	tei
Members	<p><code>att.global[TEI ab abbr abstract accMat acquisition add addName addSpan additional additions addrLine address affiliation age altIdentifier analytic anchor argument author authority availability back bibl biblFull biblScope biblStruct binaryObject binding bindingDesc birth bloc body byline calendar calendarDesc castItem castList catRef catchwords cb cell change choice cit citedRange climate closer collation collection condition corr correction correspAction correspContext correspDesc country creation date dateline death decoDesc decoNote delSpan desc dimensions distinct distributor district div divGen docDate edition editionStmt editor editorialDecl education emph encodingDesc epigraph event expan explicit extent facsimile faith figDesc figure fileDesc floatingText floruit foliation foreign forename front funder fw g gap gb genName geo geoDecl geogFeat geogName graphic handDesc handNote handNotes handShift head height hi history hyphenation idno imprint index institution interpretation item keywords kinesic l label langKnowledge langKnown langUsage language layout layoutDesc lb lg licence link linkGrp list listBibl listEvent listNym listObject listOrg listPerson listPlace listRelation listTranspose location material measure measureGrp media mentioned metamark milestone monogr msContents msDesc msIdentifier msItem msItemStruct msName name nameLink namespace nationality normalization note notesStmt num nym object objectDesc objectIdentifier objectName objectType occupation offset opener org orgName orig origDate origPlace origin p pb pc persName person personGrp persona physDesc place placeName population postCode postscript prefixDef principal profileDesc projectDesc provenance ptr pubPlace publicationStmt publisher punctuation q quotation quote ref refsDecl reg region relatedItem relation rendition repository residence resp respStmt revisionDesc role roleDesc roleName row rs salute schemaRef seal sealDesc seg segmentation series seriesStmt settlement sex sic signed soCalled soecStatus source sourceDesc sp speaker sponsor stage stamp state stdVals street subst summary supplied support supportDesc surface surname table teiCorpus teiHeader term terrain text textClass textLang time title titleStmt trailer trait transpose unclear unit vocal watermark width xenoData zone]</code></p>
Attributes	<p>Attributes</p> <p>source specifies the source from which some aspect of this element is drawn.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <code>teidata.pointer</code> separated by whitespace</p> <p>Note The <i>source</i> attribute points to an external source. When used on elements describing schema components such as <code><schemaSpec></code> or <code><moduleRef></code> it identifies the source from which declarations for the components of the object being defined may be obtained. On other elements it provides a pointer to the bibliographical source from which a quotation or citation is drawn. In either case, the location may be provided using any form of URI, for example an absolute URI, a relative URI, or private scheme URI that is expanded to an absolute URI as documented in a <code><prefixDef></code>. If more than one location is specified, the default assumption is that the required source should be obtained by combining the resources indicated.</p>
Example	<pre><p> <!-- ... --> As Willard McCarty (<bibl xml:id="mcc_2012">2012, p.2</bibl>) tells us, <quote source="#mcc_2012"></pre>
Example	<pre><p> <!-- ... --> <quote source="#chicago_15_ed">Grammatical theories are in flux, and the more we learn, the less we seem to know.</quote> <!-- ... --></pre>

	<pre></p> <!-- ... --> <bibl xml:id="chicago_15_ed"> <title level="m">The Chicago Manual of Style</title>, <edition>15th edition</edition>. <pubPlace>Chicago</pubPlace>; <publisher>University of Chicago Press</publisher> (<date>2003</date>), <biblScope unit="page">p.147</biblScope> </bibl></pre>
Example	<pre><elementRef key="p" source="tei:2.0.1"/></pre> <p>Include in the schema an element named <code><p></code> available from the TEI P5 2.0.1 release.</p>
Example	<pre><schemaSpec ident="myODD" source="mycompiledODD.xml"> <!-- further declarations specifying the components required --> </schemaSpec></pre> <p>Create a schema using components taken from the file <code>mycompiledODD.xml</code>.</p>

6.3.32. att.handFeatures

att.handFeatures provides attributes describing aspects of the hand in which a manuscript is written. [11.3.2.1. Document Hands]	
Module	tei
Members	<u>handNote</u> <u>handShift</u>
Attributes	<p>Attributes</p> <p>scribe gives a name or other identifier for the scribe believed to be responsible for this hand. Status Optional Datatype <u>teidata.name</u></p> <p>scribeRef points to a full description of the scribe concerned, typically supplied by a <code><person></code> element elsewhere in the description. Status Optional Datatype 1–# occurrences of <u>teidata.pointer</u> separated by whitespace</p> <p>script characterizes the particular script or writing style used by this hand, for example <i>secretary</i>, <i>copperplate</i>, <i>Chancery</i>, <i>Italian</i>, etc. Status Optional Datatype 1–# occurrences of <u>teidata.name</u> separated by whitespace</p> <p>scriptRef points to a full description of the script or writing style used by this hand, typically supplied by a <code><scriptNote></code> element elsewhere in the description. Status Optional Datatype 1–# occurrences of <u>teidata.pointer</u> separated by whitespace</p> <p>medium describes the tint or type of ink, e.g. <i>brown</i>, or other writing medium, e.g. <i>pencil</i> Status Optional Datatype 1–# occurrences of <u>teidata.enumerated</u> separated by whitespace</p> <p>scope specifies how widely this hand is used in the manuscript. Status Optional Datatype <u>teidata.enumerated</u> Legal values sole are: only this hand is used throughout the manuscript ma- jor this hand is used through most of the manuscript</p>

	mi- nor this hand is used occasionally in the manuscript
Note	Usually either <i>script</i> or <i>scriptRef</i> , and similarly, either <i>scribe</i> or <i>scribeRef</i> , will be supplied.

6.3.33. att.internetMedia

att.internetMedia provides attributes for specifying the type of a computer resource using a standard taxonomy.	
Module	tei
Members	<u>att.media[binaryObject graphic]</u> <u>ptr ref</u>
Attributes	<p>Attributes</p> <p>MimeType (MIME media type) specifies the applicable multimedia internet mail extension (MIME) media type</p> <p>Status Optional</p> <p>Datatype 1-# occurrences of <u>teidata.word</u> separated by whitespace</p>
Example	<p>In this example <i>MimeType</i> is used to indicate that the URL points to a TEI XML file encoded in UTF-8.</p> <pre><ref mimeType="application/tei+xml; charset=UTF-8" target="http://sourceforge.net/p/tei/code/HEAD/tree/trunk/P5/Source/guidelines-en.xml"/></pre>
Note	This attribute class provides an attribute for describing a computer resource, typically available over the internet, using a value taken from a standard taxonomy. At present only a single taxonomy is supported, the Multipurpose Internet Mail Extensions (MIME) Media Type system. This typology of media types is defined by the Internet Engineering Task Force in RFC 2046. The list of types is maintained by the Internet Assigned Numbers Authority (IANA). The <i>MimeType</i> attribute must have a value taken from this list.

6.3.34. att.linguistic

att.linguistic provides a set of attributes concerning linguistic features of tokens, for usage within token-level elements, specifically <w> and <pc> in the analysis module. [17.4.2. Lightweight Linguistic Annotation]	
Module	analysis
Members	<u>pc</u>
Attributes	<p>Attributes</p> <p>lemma provides a lemma (base form) for the word, typically uninflected and serving both as an identifier (e.g. in dictionary contexts, as a headword), and as a basis for potential inflections.</p> <p>Status Optional</p> <p>Datatype <u>teidata.text</u></p> <pre><w lemma="wife">wives</w> <w lemma="Arznei">Artzeneyen</w></pre> <p>lemmaRef provides a pointer to a definition of the lemma for the word, for example in an online lexicon.</p> <p>Status Optional</p> <p>Datatype <u>teidata.pointer</u></p> <pre><w type="verb" lemma="hit" lemmaRef="http://www.example.com/lexicon/hitvb.xml">hitt<m type="suffix">ing</m> </w></pre> <p>pos (part of speech) indicates the part of speech assigned to a token (i.e. information on whether it is a noun, adjective, or verb), usually according to some official reference vocabulary (e.g. for German: STTS, for English: CLAWS, for Polish: NKJP, etc.).</p> <p>Status Optional</p> <p>Datatype <u>teidata.text</u></p> <p>The German sentence ‘Wir fahren in den Urlaub.’ tagged with the Stuttgart-Tuebingen-Tagset (STTS).</p>

```
<s>
<w pos="PPER">Wir</w>
<w pos="VVFIN">fahren</w>
<w pos="APPR">in</w>
<w pos="ART">den</w>
<w pos="NN">Urlaub</w>
<w pos="$.">.</w>
</s>
```

The English sentence ‘We’re going to Brazil.’ tagged with the CLAWS-5 tagset, arranged inline (with significant whitespace).

```
<p><w pos="PNP">We</w><w pos="VBB">'re</w> <w pos="VVG">going</w> <w pos="PRP">to</w> <w pos="NN">Urlaub</w>
```

The English sentence ‘We’re going on vacation to Brazil for a month!’ tagged with the CLAWS-7 tagset and arranged sequentially.

```
<p>
<w pos="PPIS2">We</w>
<w pos="VBR">'re</w>
<w pos="VVG">going</w>
<w pos="II">on</w>
<w pos="NN1">vacation</w>
<w pos="II">to</w>
<w pos="NP1">Brazil</w>
<w pos="IP">for</w>
<w pos="AT1">a</w>
<w pos="NNT1">month</w>
<pc pos="!">!</pc>
</p>
```

msd (morphosyntactic description) supplies morphosyntactic information for a token, usually according to some official reference vocabulary (e.g. for German: STTS-large tagset; for a feature description system designed as (pragmatically) universal, see Universal Features).

Status Optional

Datatype teidata.text

```
<ab>
<w pos="PPER"
msd="1.Pl.*_Nom">Wir</w>
<w pos="VVFIN"
msd="1.Pl.Pres.Ind">fahren</w>
<w pos="APPR"
msd="-->in</w>
<w pos="ART"
msd="Def.Masc.Akk.Sg">den</w>
<w pos="NN"
msd="Masc.Akk.Sg">Urlaub</w>
<pc pos="$."
msd="-->.</pc>
</ab>
```

join when present, it provides information on whether the token in question is adjacent to another, and if so, on which side. The definition of this attribute is adapted from ISO MAF (Morpho-syntactic Annotation Framework), ISO 24611:2012.

Status Optional

Datatype teidata.text

Legal values **no**

are: (the token is not adjacent to another)

left

(there is no whitespace on the left side of the token)

right

(there is no whitespace on the right side of the token)

both

(there is no whitespace on either side of the token)

over-

lap (the token overlaps with another; other devices (specifying the extent and the area of overlap) are needed to more precisely locate this token in the character stream)

The example below assumes that the lack of whitespace is marked redundantly, by using the appropriate values of *join*.

```
<s>
<pc join="right">"</pc>
<w join="left">Friends</w>
<w>will</w>
<w>be</w>
<w join="right">friends</w>
<pc join="both">.</pc>
<pc join="left">"</pc>
</s>
```

Note that a project may make a decision to only indicate lack of whitespace in one direction, or do that non-redundantly. The existing proposal is the broadest possible, on the assumption that we adopt the "streamable view", where all the information on the current element needs to be represented locally.

The English sentence ‘We’re going on vacation.’ tagged with the CLAWS-5 tagset, arranged sequentially, tagged on the assumption that only the lack of the preceding whitespace is indicated.

```
<p>
<w pos="PNP">We</w>
<w pos="VBB"
join="left">'re</w>
<w pos="VVG">going</w>
<w pos="PRP">on</w>
<w pos="NN1">vacation</w>
<pc pos="PUN"
join="left">.</pc>
</p>
```

Note	These attributes make it possible to encode simple language corpora and to add a layer of linguistic information to any tokenized resource. See section 17.4.2. Lightweight Linguistic Annotation for discussion.
-------------	---

6.3.35. *att.measurement*

att.measurement provides attributes to represent a regularized or normalized measurement.

Module	tei						
Members	<u>measure</u> <u>measureGrp</u> <u>unit</u>						
Attributes	<p>Attributes</p> <p>unit indicates the units used for the measurement, usually using the standard symbol for the desired units.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td><u>teidata.enumerated</u></td> </tr> <tr> <td>Suggested values include:</td> <td> m (metre) SI base unit of length kg (kilogram) SI base unit of mass s (second) SI base unit of time Hz (hertz) SI unit of frequency Pa (pascal) SI unit of pressure or stress # (ohm) SI unit of electric resistance </td> </tr> </table>	Status	Optional	Datatype	<u>teidata.enumerated</u>	Suggested values include:	m (metre) SI base unit of length kg (kilogram) SI base unit of mass s (second) SI base unit of time Hz (hertz) SI unit of frequency Pa (pascal) SI unit of pressure or stress # (ohm) SI unit of electric resistance
Status	Optional						
Datatype	<u>teidata.enumerated</u>						
Suggested values include:	m (metre) SI base unit of length kg (kilogram) SI base unit of mass s (second) SI base unit of time Hz (hertz) SI unit of frequency Pa (pascal) SI unit of pressure or stress # (ohm) SI unit of electric resistance						

	<p>L (litre) 1 dm³</p> <p>t (tonne) 10³ kg</p> <p>ha (hectare) 1 hm²</p> <p># (ångström) 10^{−10} m</p> <p>mL (millilitre)</p> <p>cm (centimetre)</p> <p>dB (decibel) see remarks, below</p> <p>kbit (kilobit) 10³ or 1000 bits</p> <p>Kib- it (kibibit) 2¹⁰ or 1024 bits</p> <p>kB (kilobyte) 10³ or 1000 bytes</p> <p>KiB (kibibyte) 2¹⁰ or 1024 bytes</p> <p>MB (megabyte) 10⁶ or 1#000#000 bytes</p> <p>MiB (mebibyte) 2²⁰ or 1#048#576 bytes</p>
	<p>Note If the measurement being represented is not expressed in a particular unit, but rather is a number of discrete items, the unit count should be used, or the <i>unit</i> attribute may be left unspecified.</p> <p>Wherever appropriate, a recognized SI unit name should be used (see further http://www.bipm.org/en/publications/si-brochure/; http://physics.nist.gov/cuu/Units/). The list above is indicative rather than exhaustive.</p>
unitRef	<p>points to a unique identifier stored in the <i>xml:id</i> of a <unitDef> element that defines a unit of measure.</p> <p>Status Optional</p> <p>Datatype <u>teidata.pointer</u></p>
quantity	<p>specifies the number of the specified units that comprise the measurement</p> <p>Status Optional</p> <p>Datatype <u>teidata.numeric</u></p>
commodity	<p>indicates the substance that is being measured</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <u>teidata.word</u> separated by whitespace</p> <p>Note In general, when the commodity is made of discrete entities, the plural form should be used, even when the measurement is of only one of them.</p>
Schematron	<sch:rule context="tei:*[@unitRef]"> <sch:report test="@unit" role="info">The @unit attribute may be unnecessary when @unitRef is present.</sch:report> </sch:rule>

Note	This attribute class provides a triplet of attributes that may be used either to regularize the values of the measurement being encoded, or to normalize them with respect to a standard measurement system. <pre><l>So weren't you gonna buy <measure quantity="0.5" unit="gal" commodity="ice cream">half a gallon</measure>, baby</l> <l>So won't you go and buy <measure quantity="1.893" unit="L" commodity="ice cream">half a gallon</measure>, baby?</l></pre>
Note	The unit should normally be named using the standard abbreviation for an SI unit (see further http://www.bipm.org/en/publications/si-brochure/ ; http://physics.nist.gov/cuu/Units/). However, encoders may also specify measurements using informally defined units such as lines or characters.

6.3.36. att.media

att.media provides attributes for specifying display and related properties of external media.																			
Module	tei																		
Members	binaryObject graphic																		
Attributes	<p>Attributes att.internetMedia (@MimeType)</p> <table> <tr> <td>width</td> <td>Where the media are displayed, indicates the display width</td> </tr> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.outputMeasurement</td> </tr> <tr> <td>height</td> <td>Where the media are displayed, indicates the display height</td> </tr> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.outputMeasurement</td> </tr> <tr> <td>scale</td> <td>Where the media are displayed, indicates a scale factor to be applied when generating the desired display size</td> </tr> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>teidata.numeric</td> </tr> </table>	width	Where the media are displayed, indicates the display width	Status	Optional	Datatype	teidata.outputMeasurement	height	Where the media are displayed, indicates the display height	Status	Optional	Datatype	teidata.outputMeasurement	scale	Where the media are displayed, indicates a scale factor to be applied when generating the desired display size	Status	Optional	Datatype	teidata.numeric
width	Where the media are displayed, indicates the display width																		
Status	Optional																		
Datatype	teidata.outputMeasurement																		
height	Where the media are displayed, indicates the display height																		
Status	Optional																		
Datatype	teidata.outputMeasurement																		
scale	Where the media are displayed, indicates a scale factor to be applied when generating the desired display size																		
Status	Optional																		
Datatype	teidata.numeric																		

6.3.37. att.milestoneUnit

att.milestoneUnit provides an attribute to indicate the type of section which is changing at a specific milestone. [3.10.3. Milestone Elements 2.3.6.3. Milestone Method 2.3.6. The Reference System Declaration]									
Module	core								
Members	milestone refState								
Attributes	<p>Attributes</p> <table> <tr> <td>unit</td> <td>provides a conventional name for the kind of section changing at this milestone.</td> </tr> <tr> <td>Status</td> <td>Required</td> </tr> <tr> <td>Datatype</td> <td>teidata.enumerated</td> </tr> <tr> <td>Suggested values include:</td> <td> <p>page physical page breaks (synonymous with the pb element).</p> <p>col- column breaks.</p> <p>line line breaks (synonymous with the lb element).</p> <p>book any units termed book, liber, etc.</p> <p>po- individual poems in a collection.</p> <p>can- cantos or other major sections of a poem.</p> </td> </tr> </table>	unit	provides a conventional name for the kind of section changing at this milestone.	Status	Required	Datatype	teidata.enumerated	Suggested values include:	<p>page physical page breaks (synonymous with the pb element).</p> <p>col- column breaks.</p> <p>line line breaks (synonymous with the lb element).</p> <p>book any units termed book, liber, etc.</p> <p>po- individual poems in a collection.</p> <p>can- cantos or other major sections of a poem.</p>
unit	provides a conventional name for the kind of section changing at this milestone.								
Status	Required								
Datatype	teidata.enumerated								
Suggested values include:	<p>page physical page breaks (synonymous with the pb element).</p> <p>col- column breaks.</p> <p>line line breaks (synonymous with the lb element).</p> <p>book any units termed book, liber, etc.</p> <p>po- individual poems in a collection.</p> <p>can- cantos or other major sections of a poem.</p>								

	<p>speak- er changes of speaker or narrator.</p> <p>stan- za stanzas within a poem, book, or canto.</p> <p>act acts within a play.</p> <p>scene scenes within a play or act.</p> <p>sec- tion sections of any kind.</p> <p>ab- sent passages not present in the reference edition.</p> <p>un- numpassages present in the text, but not to be included as part of the reference.</p> <pre style="background-color: #e0e0e0; padding: 5px;">< milestone n="23" ed="La" unit="Dreissiger" /> ... < milestone n="24" ed="AV" unit="verse" /> ...</pre>
	<p>Note If the milestone marks the beginning of a piece of text not present in the reference edition, the special value <i>absent</i> may be used as the value of <i>unit</i>. The normal interpretation is that the reference edition does not contain the text which follows, until the next <code>< milestone></code> tag for the edition in question is encountered.</p> <p>In addition to the values suggested, other terms may be appropriate (e.g. <i>Stephanus</i> for the Stephanus numbers in Plato).</p>

6.3.38. att.msClass

att.msClass provides an attribute to indicate text type or classification. [10.6. Intellectual Content 10.6.1. The msItem and msItemStruct Elements]					
Module	msdescription				
Members	<u>msContents</u> <u>msItem</u> <u>msItemStruct</u>				
Attributes	<p>Attributes</p> <p>class identifies the text types or classifications applicable to this item by pointing to other elements or resources defining the classification concerned.</p> <table> <tr> <td>Status</td><td>Optional</td></tr> <tr> <td>Datatype</td><td>1–# occurrences of <u>teidata.pointer</u> separated by whitespace</td></tr> </table>	Status	Optional	Datatype	1–# occurrences of <u>teidata.pointer</u> separated by whitespace
Status	Optional				
Datatype	1–# occurrences of <u>teidata.pointer</u> separated by whitespace				

6.3.39. att.msExcerpt

att.msExcerpt (manuscript excerpt) provides attributes used to describe excerpts from a manuscript placed in a description thereof. [10.6. Intellectual Content]					
Module	msdescription				
Members	<u>explicit</u> <u>msContents</u> <u>msItem</u> <u>msItemStruct</u> <u>quote</u>				
Attributes	<p>Attributes</p> <p>defective indicates whether the passage being quoted is defective, i.e. incomplete through loss or damage.</p> <table> <tr> <td>Status</td><td>Optional</td></tr> <tr> <td>Datatype</td><td><u>teidata.xTruthValue</u></td></tr> </table>	Status	Optional	Datatype	<u>teidata.xTruthValue</u>
Status	Optional				
Datatype	<u>teidata.xTruthValue</u>				
Note	In the case of an incipit, indicates whether the incipit as given is defective, i.e. the first words of the text as preserved, as opposed to the first words of the work itself. In the case of				

	an explicit, indicates whether the explicit as given is defective, i.e. the final words of the text as preserved, as opposed to what the closing words would have been had the text of the work been whole.
--	---

6.3.40. *att.naming*

att.naming provides attributes common to elements which refer to named persons, places, organizations etc. [3.5.1. Referring Strings 13.3.6. Names and Nyms]									
Module	tei								
Members	<p><u>att.personal</u>[addName forename genName name objectName orgName persName place-Name roleName surname] affiliation author birth bloc climate collection country death district editor education event geogFeat geogName institution nationality occupation offset origPlace population pubPlace region repository residence rs settlement socceStatus state terrain trait</p>								
Attributes	<p>Attributes <u>att.canonical</u> (@key, @ref)</p> <p>role may be used to specify further information about the entity referenced by this name in the form of a set of whitespace-separated values, for example the occupation of a person, or the status of a place.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>1–# occurrences of <u>teidata.enumerated</u> separated by whitespace</td> </tr> </table> <p>nymRef (reference to the canonical name) provides a means of locating the canonical form (<i>nym</i>) of the names associated with the object named by the element bearing it.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td>1–# occurrences of <u>teidata.pointer</u> separated by whitespace</td> </tr> </table> <p>Note The value must point directly to one or more XML elements by means of one or more URIs, separated by whitespace. If more than one is supplied, the implication is that the name is associated with several distinct canonical names.</p>	Status	Optional	Datatype	1–# occurrences of <u>teidata.enumerated</u> separated by whitespace	Status	Optional	Datatype	1–# occurrences of <u>teidata.pointer</u> separated by whitespace
Status	Optional								
Datatype	1–# occurrences of <u>teidata.enumerated</u> separated by whitespace								
Status	Optional								
Datatype	1–# occurrences of <u>teidata.pointer</u> separated by whitespace								

6.3.41. *att.notated*

att.notated provides an attribute to indicate any specialised notation used for element content.					
Module	tei				
Members	<u>quote</u> <u>seg</u>				
Attributes	<p>Attributes</p> <p>notation names the notation used for the content of the element.</p> <table> <tr> <td>Status</td> <td>Optional</td> </tr> <tr> <td>Datatype</td> <td><u>teidata.enumerated</u></td> </tr> </table>	Status	Optional	Datatype	<u>teidata.enumerated</u>
Status	Optional				
Datatype	<u>teidata.enumerated</u>				

6.3.42. *att.patternReplacement*

att.patternReplacement provides attributes for regular-expression matching and replacement. [16.2.3. Using Abbreviated Pointers 2.3.6.3. Milestone Method 2.3.6. The Reference System Declaration 2.3.6.2. Search-and-Replace Method]					
Module	header				
Members	<u>prefixDef</u>				
Attributes	<p>Attributes</p> <p>matchPattern specifies a regular expression against which the values of other attributes can be matched.</p> <table> <tr> <td>Status</td> <td>Required</td> </tr> <tr> <td>Datatype</td> <td><u>teidata.pattern</u></td> </tr> </table>	Status	Required	Datatype	<u>teidata.pattern</u>
Status	Required				
Datatype	<u>teidata.pattern</u>				

	<p>Note The syntax used should follow that defined by W3C XPath syntax. Note that parenthesized groups are used not only for establishing order of precedence and atoms for quantification, but also for creating subpatterns to be referenced by the <i>replacementPattern</i> attribute.</p> <p>replacementPattern specifies a ‘replacement pattern’, that is, the skeleton of a relative or absolute URI containing references to groups in the <i>matchPattern</i> which, once subpattern substitution has been performed, complete the URI.</p> <p>Status Required</p> <p>Datatype <u>teidata.replacement</u></p> <p>Note The strings \$1, \$2 etc. are references to the corresponding group in the regular expression specified by <i>matchPattern</i> (counting open parenthesis, left to right). Processors are expected to replace them with whatever matched the corresponding group in the regular expression. If a digit preceded by a dollar sign is needed in the actual replacement pattern (as opposed to being used as a back reference), the dollar sign must be written as %24.</p>
--	--

6.3.43. att.personal

att.personal (attributes for components of names usually, but not necessarily, personal names) common attributes for those elements which form part of a name usually, but not necessarily, a personal name. [13.2.1. Personal Names]	
Module	tei
Members	<u>addName</u> <u>forename</u> <u>genName</u> <u>name</u> <u>objectName</u> <u>orgName</u> <u>persName</u> <u>placeName</u> <u>roleName</u> <u>surname</u>
Attributes	<p>Attributes <u>att.naming</u> (@role, @nymRef) (<u>att.canonical</u> (@key, @ref))</p> <p>full indicates whether the name component is given in full, as an abbreviation or simply as an initial.</p> <p>Status Optional</p> <p>Datatype <u>teidata.enumerated</u></p> <p>Legal values yes are: the name component is spelled out in full.[Default]</p> <p>abb (abbreviated) the name component is given in an abbreviated form.</p> <p>init (initial letter) the name component is indicated only by one initial.</p> <p>sort specifies the sort order of the name component in relation to others within the name.</p> <p>Status Optional</p> <p>Datatype <u>teidata.count</u></p>

6.3.44. att.placement

att.placement provides attributes for describing where on the source page or object a textual element appears. [3.4.3. Additions, Deletions, and Omissions 11.3.1.4. Additions and Deletions]	
Module	tei
Members	<u>addSpan</u> <u>figure</u> <u>fw</u> <u>head</u> <u>label</u> <u>metamark</u> <u>note</u> <u>stage</u> <u>trailer</u>
Attributes	<p>Attributes</p> <p>place specifies where this item is placed.</p> <p>Status Recommended</p>

	<p>Datatype 1-# occurrences of <u>teidata.enumerated</u> separated by whitespace</p> <p>Suggested values include:</p> <ul style="list-style-type: none"> be- low below the line bot- tom at the foot of the page mar- gin in the margin (left, right, or both) top at the top of the page op- po- on the opposite, i.e. facing, page site over- leaf on the other side of the leaf above above the line end at the end of e.g. chapter or volume. in- line within the body of the text. in- spacen a predefined space, for example left by an earlier scribe. <pre><add place="margin">[An addition written in the margin]</add> <add place="bottom opposite">[An addition written at the foot of the current page and also on the facing page]</add> <note place="bottom">Ibid, p.7</note></pre>
--	---

6.3.45. *att.pointing*

att.pointing provides a set of attributes used by all elements which point to other elements by means of one or more URI references. [1.3.1.1.2. Language Indicators 3.6. Simple Links and Cross-References]

Module	tei
Members	<code>att.pointing.group</code> [<code>linkGrp</code>] <code>calendar</code> <code>catRef</code> <code>citedRange</code> <code>licence</code> <code>link</code> <code>note</code> <code>ptr</code> <code>ref</code> <code>term</code>
Attributes	<p>Attributes</p> <p>targetLang specifies the language of the content to be found at the destination referenced by <i>target</i>, using a ‘language tag’ generated according to BCP 47.</p> <p>Status Optional</p> <p>Datatype <u>teidata.language</u></p> <p>Schematron <code><sch:rule context="tei:[not(self::tei:schemaSpec)][@targetLang]"></code> <code><sch:assert test="@target">@targetLang should only</code> <code>be used on <sch:name/> if @target is specified.</sch:as-</code> <code>sert> </sch:rule></code></p> <pre><linkGrp xml:id="pol-swh_aln_2.1-linkGrp"> <ptr xml:id="pol-swh_aln_2.1.1-ptr" target="pol/UDHR/text.xml#pol_txt_1-head" type="tuv" targetLang="pl"/> <ptr xml:id="pol-swh_aln_2.1.2-ptr" target="swh/UDHR/text.xml#swh_txt_1-head" type="tuv" targetLang="sw"/> </linkGrp></pre>

	In the example above, the <code><linkGrp></code> combines pointers at parallel fragments of the <i>Universal Declaration of Human Rights</i> : one of them is in Polish, the other in Swahili.
target	<p>Note The value must conform to BCP 47. If the value is a private use code (i.e., starts with x- or contains -x-), a <code><language></code> element with a matching value for its <i>ident</i> attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their IETFIInternet Engineering Task Force definitions.</p> <p>Status Optional</p> <p>Datatype 1–# occurrences of <code>teidata.pointer</code> separated by whitespace</p> <p>Note One or more syntactically valid URI references, separated by whitespace. Because whitespace is used to separate URIs, no whitespace is permitted inside a single URI. If a whitespace character is required in a URI, it should be escaped with the normal mechanism, e.g. <code>TEI%20Consortium</code>.</p>
evaluate	<p>specifies the intended meaning when the target of a pointer is itself a pointer.</p> <p>Status Optional</p> <p>Datatype <code>teidata.enumerated</code></p> <p>Legal values <code>all</code> are:</p> <ul style="list-style-type: none"> one if the element pointed to is itself a pointer, then the target of that pointer will be taken, and so on, until an element is found which is not a pointer. one if the element pointed to is itself a pointer, then its target (whether a pointer or not) is taken as the target of this pointer. none no further evaluation of targets is carried out beyond that needed to find the element specified in the pointer's target. <p>Note If no value is given, the application program is responsible for deciding (possibly on the basis of user input) how far to trace a chain of pointers.</p>

6.3.46. `att.pointing.group`

att.pointing.group provides a set of attributes common to all elements which enclose groups of pointer elements. [16. Linking, Segmentation, and Alignment]

Module	tei
Members	<code>linkGrp</code>
Attributes	<p>Attributes <code>att.pointing</code> (@targetLang, @target, @evaluate) <code>att.typed</code> (@type, @subtype)</p> <p>domains optionally specifies the identifiers of the elements within which all elements indicated by the contents of this element lie.</p> <p>Status Optional</p> <p>Datatype 2–# occurrences of <code>teidata.pointer</code> separated by whitespace</p> <p>Note If this attribute is supplied every element specified as a target must be contained within the element or elements named by it. An application may choose whether or not</p>

	<p>to report failures to satisfy this constraint as errors, but may not access an element of the right identifier but in the wrong context. If this attribute is not supplied, then target elements may appear anywhere within the target document.</p> <p>targFunc (target function) describes the function of each of the values of the <i>target</i> attribute of the enclosed <code><link></code>, <code><join></code>, or <code><alt></code> tags.</p> <p>Status Optional</p> <p>Datatype 2-# occurrences of <code>teidata.word</code> separated by whitespace</p> <p>Note The number of separate values must match the number of values in the <i>target</i> attribute in the enclosed <code><link></code>, <code><join></code>, or <code><alt></code> tags (an intermediate <code><ptr></code> element may be needed to accomplish this). It should also match the number of values in the <i>domains</i> attribute, of the current element, if one has been specified.</p>
--	---

6.3.47. *att.ranging*

att.ranging provides attributes for describing numerical ranges.	
Module	tei
Members	<code>att.dimensions[add addSpan age birth date death del delSpan dimensions floruit gap geogFeat height offset origDate population space state subst supplied time trait unclear width]</code> <code>num</code>
Attributes	<p>Attributes</p> <p>atLeast gives a minimum estimated value for the approximate measurement.</p> <p>Status Optional</p> <p>Datatype <code>teidata.numeric</code></p> <p>atMost gives a maximum estimated value for the approximate measurement.</p> <p>Status Optional</p> <p>Datatype <code>teidata.numeric</code></p> <p>min where the measurement summarizes more than one observation or a range, supplies the minimum value observed.</p> <p>Status Optional</p> <p>Datatype <code>teidata.numeric</code></p> <p>max where the measurement summarizes more than one observation or a range, supplies the maximum value observed.</p> <p>Status Optional</p> <p>Datatype <code>teidata.numeric</code></p> <p>confidence specifies the degree of statistical confidence (between zero and one) that a value falls within the range specified by <i>min</i> and <i>max</i>, or the proportion of observed values that fall within that range.</p> <p>Status Optional</p> <p>Datatype <code>teidata.probability</code></p>
Example	<pre>The MS. was lost in transmission by mail from <del rend="overstrike"> <gap reason="illegible" extent="one or two letters" atLeast="1" atMost="2" unit="chars"/> Philadelphia to the Graphic office, New York.</pre>

6.3.48. *att.resourced*

att.resourced provides attributes by which a resource (such as an externally held media file) may be located.	
Module	tei
Members	<code>graphic media schemaRef</code>
Attributes	Attributes

	<p>url (uniform resource locator) specifies the URL from which the media concerned may be obtained.</p> <p>Status Required</p> <p>Datatype teidata.pointer</p>
--	---

6.3.49. *att.segLike*

att.segLike provides attributes for elements used for arbitrary segmentation. [16.3. Blocks, Segments, and Anchors 17.1. Linguistic Segment Categories]

Module	tei
Members	pc seg
Attributes	<p>Attributes att.datcat (@datcat, @valueDatcat) att.fragmentable (@part)</p> <p>function characterizes the function of the segment.</p> <p>Status Optional</p> <p>Datatype teidata.enumerated</p> <p>Note Attribute values will often vary depending on the type of element to which they are attached. For example, a <c1>, may take values such as coordinate, subject, adverbial etc. For a <phr>, such values as subject, predicate etc. may be more appropriate. Such constraints will typically be implemented by a project-defined customization.</p>

6.3.50. *att.sortable*

att.sortable provides attributes for elements in lists or groups that are sortable, but whose sorting key cannot be derived mechanically from the element content. [9.1. Dictionary Body and Overall Structure]

Module	tei
Members	bibl biblFull biblStruct correspAction event idno item list listBibl listEvent listNym listObject listOrg listPerson listPlace listRelation msDesc nym object org person personGrp persona place relation term
Attributes	<p>Attributes</p> <p>sortKey supplies the sort key for this element in an index, list or group which contains it.</p> <p>Status Optional</p> <p>Datatype teidata.word</p> <div style="background-color: #f0f0f0; padding: 5px;"> David's other principal backer, Josiah ha-Kohen <index indexName="NAMES"><term sortKey="Azarya_Josiah_Kohen">Josiah ha-Kohen b. Azarya</term></index> b. Azarya, son of one of the last gaons of Sura was David's own first cousin. </div> <p>Note The sort key is used to determine the sequence and grouping of entries in an index. It provides a sequence of characters which, when sorted with the other values, will produce the desired order; specifics of sort key construction are application-dependent</p> <p>Dictionary order often differs from the collation sequence of machine-readable character sets; in English-language dictionaries, an entry for 4-H will often appear alphabetized under 'fourth', and McCoy may be alphabetized under 'maccoy', while A1, A4, and A5 may all appear in numeric order 'alphabetized' between 'a' and 'AA'. The sort key is required if the orthography of the dictionary entry does not suffice to determine its location.</p>

6.3.51. *att.spanning*

att.spanning provides attributes for elements which delimit a span of text by pointing mechanisms rather than by enclosing it. [11.3.1.4. Additions and Deletions 1.3.1. Attribute Classes]

Module	tei
Members	<u>addSpan</u> <u>cb</u> <u>delSpan</u> <u>gb</u> <u>index</u> <u>lb</u> <u>metamark</u> <u>milestone</u> <u>pb</u>
Attributes	<p>Attributes</p> <p>spanTo indicates the end of a span initiated by the element bearing this attribute.</p> <p>Status Optional</p> <p>Datatype <u>teidata.pointer</u></p> <p>Schematron The @spanTo attribute must point to an element following the current element $<\text{sch:rule context}=\text{"tei:*\[@spanTo\]"}> <\text{sch:assert test}=\text{"id(substring(@spanTo,2)) and following:*:*\[@xml:id=substring(current()@\spanTo,2)\]"}>$ The element indicated by @spanTo (<sch:value-of select="@spanTo"/>) must follow the current element $<\text{sch:name}/> </\text{sch:assert}> </\text{sch:rule}>$</p>
Note	The span is defined as running in document order from the start of the content of the pointing element to the end of the content of the element pointed to by the <i>spanTo</i> attribute (if any). If no value is supplied for the attribute, the assumption is that the span is coextensive with the pointing element. If no content is present, the assumption is that the starting point of the span is immediately following the element itself.

6.3.52. *att.styleDef*

att.styleDef provides attributes to specify the name of a formal definition language used to provide formatting or rendition information.	
Module	tei
Members	<u>rendition</u>
Attributes	<p>Attributes</p> <p>scheme identifies the language used to describe the rendition.</p> <p>Status Optional</p> <p>Datatype <u>teidata.enumerated</u></p> <p>Legal values css are: Cascading Stylesheet Language</p> <p>xslfo Extensible Stylesheet Language Formatting Objects</p> <p>free Informal free text description</p> <p>oth- er A user-defined rendition description language</p> <p>Note If no value for the @scheme attribute is provided, then the default assumption should be that CSS is in use.</p> <p>schemeVersion supplies a version number for the style language provided in <i>scheme</i>.</p> <p>Status Optional</p> <p>Datatype <u>teidata.versionNumber</u></p> <p>Schematron $<\text{sch:rule context}=\text{"tei:*\[@schemeVersion\]"}> <\text{sch:assert test}=\text{"@scheme and not(@scheme = 'free')"}>$ @schemeVersion can only be used if @scheme is specified. $</\text{sch:assert}> </\text{sch:rule}>$</p> <p>Note If <i>schemeVersion</i> is used, then <i>scheme</i> should also appear, with a value other than free.</p>

6.3.53. *att.tableDecoration*

att.tableDecoration provides attributes used to decorate rows or cells of a table. [14. Tables, Formulae, Graphics and Notated Music]																															
Module	figures																														
Members	<u>cell</u> <u>row</u>																														
Attributes	<p>Attributes</p> <table> <tr> <td>role</td> <td>indicates the kind of information held in this cell or in each cell of this row.</td> </tr> <tr> <td></td> <td>Status Optional</td> </tr> <tr> <td></td> <td>Datatype <u>teidata.enumerated</u></td> </tr> <tr> <td>Suggested values include:</td> <td>la- bel labelling or descriptive information only. da- ta data values.[Default]</td> </tr> <tr> <td></td> <td>Note When this attribute is specified on a row, its value is the default for all cells in this row. When specified on a cell, its value overrides any default specified by the <i>role</i> attribute of the parent <u><row></u> element.</td> </tr> <tr> <td>rows</td> <td>indicates the number of rows occupied by this cell or row.</td> </tr> <tr> <td></td> <td>Status Optional</td> </tr> <tr> <td></td> <td>Datatype <u>teidata.count</u></td> </tr> <tr> <td></td> <td>Default 1</td> </tr> <tr> <td></td> <td>Note A value greater than one indicates that this cell spans several rows. Where several cells span multiple rows, it may be more convenient to use nested tables.</td> </tr> <tr> <td>cols</td> <td>(columns) indicates the number of columns occupied by this cell or row.</td> </tr> <tr> <td></td> <td>Status Optional</td> </tr> <tr> <td></td> <td>Datatype <u>teidata.count</u></td> </tr> <tr> <td></td> <td>Default 1</td> </tr> <tr> <td></td> <td>Note A value greater than one indicates that this cell or row spans several columns. Where an initial cell spans an entire row, it may be better treated as a heading.</td> </tr> </table>	role	indicates the kind of information held in this cell or in each cell of this row.		Status Optional		Datatype <u>teidata.enumerated</u>	Suggested values include:	la- bel labelling or descriptive information only. da- ta data values.[Default]		Note When this attribute is specified on a row, its value is the default for all cells in this row. When specified on a cell, its value overrides any default specified by the <i>role</i> attribute of the parent <u><row></u> element.	rows	indicates the number of rows occupied by this cell or row.		Status Optional		Datatype <u>teidata.count</u>		Default 1		Note A value greater than one indicates that this cell spans several rows. Where several cells span multiple rows, it may be more convenient to use nested tables.	cols	(columns) indicates the number of columns occupied by this cell or row.		Status Optional		Datatype <u>teidata.count</u>		Default 1		Note A value greater than one indicates that this cell or row spans several columns. Where an initial cell spans an entire row, it may be better treated as a heading.
role	indicates the kind of information held in this cell or in each cell of this row.																														
	Status Optional																														
	Datatype <u>teidata.enumerated</u>																														
Suggested values include:	la- bel labelling or descriptive information only. da- ta data values.[Default]																														
	Note When this attribute is specified on a row, its value is the default for all cells in this row. When specified on a cell, its value overrides any default specified by the <i>role</i> attribute of the parent <u><row></u> element.																														
rows	indicates the number of rows occupied by this cell or row.																														
	Status Optional																														
	Datatype <u>teidata.count</u>																														
	Default 1																														
	Note A value greater than one indicates that this cell spans several rows. Where several cells span multiple rows, it may be more convenient to use nested tables.																														
cols	(columns) indicates the number of columns occupied by this cell or row.																														
	Status Optional																														
	Datatype <u>teidata.count</u>																														
	Default 1																														
	Note A value greater than one indicates that this cell or row spans several columns. Where an initial cell spans an entire row, it may be better treated as a heading.																														

6.3.54. *att.timed*

att.timed provides attributes common to those elements which have a duration in time, expressed either absolutely or by reference to an alignment map. [8.3.5. Temporal Information]															
Module	tei														
Members	<u>binaryObject</u> <u>gap</u> <u>kinesic</u> <u>media</u> <u>vocal</u>														
Attributes	<p>Attributes <u>att.duration</u> (<u>att.duration.w3c</u> (@dur)) (<u>att.duration.iso</u> (@dur-iso))</p> <table> <tr> <td>start</td> <td>indicates the location within a temporal alignment at which this element begins.</td> </tr> <tr> <td></td> <td>Status Optional</td> </tr> <tr> <td></td> <td>Datatype <u>teidata.pointer</u></td> </tr> <tr> <td></td> <td>Note If no value is supplied, the element is assumed to follow the immediately preceding element at the same hierarchical level.</td> </tr> <tr> <td>end</td> <td>indicates the location within a temporal alignment at which this element ends.</td> </tr> <tr> <td></td> <td>Status Optional</td> </tr> <tr> <td></td> <td>Datatype <u>teidata.pointer</u></td> </tr> </table>	start	indicates the location within a temporal alignment at which this element begins.		Status Optional		Datatype <u>teidata.pointer</u>		Note If no value is supplied, the element is assumed to follow the immediately preceding element at the same hierarchical level.	end	indicates the location within a temporal alignment at which this element ends.		Status Optional		Datatype <u>teidata.pointer</u>
start	indicates the location within a temporal alignment at which this element begins.														
	Status Optional														
	Datatype <u>teidata.pointer</u>														
	Note If no value is supplied, the element is assumed to follow the immediately preceding element at the same hierarchical level.														
end	indicates the location within a temporal alignment at which this element ends.														
	Status Optional														
	Datatype <u>teidata.pointer</u>														

	Note	If no value is supplied, the element is assumed to precede the immediately following element at the same hierarchic level.
--	-------------	--

6.3.55. *att.transcriptional*

att.transcriptional provides attributes specific to elements encoding authorial or scribal intervention in a text when transcribing manuscript or similar sources. [11.3.1.4. Additions and Deletions]

Module	tei
Members	<u>add</u> <u>addSpan</u> <u>del</u> <u>delSpan</u> <u>subst</u>
Attributes	<p>Attributes <u>att.editLike</u> (@evidence, @instant) <u>att.written</u> (@hand)</p> <p>status indicates the effect of the intervention, for example in the case of a deletion, strikeouts which include too much or too little text, or in the case of an addition, an insertion which duplicates some of the text already present.</p> <p>Status Optional</p> <p>Datatype <u>teidata.enumerated</u></p> <p>Sample values include: du- all of the text indicated as an addition duplicates cate-pame text that is in the original, whether the duplication is word-for-word or less exact.</p> <p>du- part of the text indicated as an addition duplicates cate-pame text that is in the original</p> <p>tial</p> <p>ex-</p> <p>cess Some text at the beginning of the deletion is tart marked as deleted even though it clearly should not be deleted.</p> <p>ex-</p> <p>cessEnd The text at the end of the deletion is marked as deleted even though it clearly should not be deleted.</p> <p>short-</p> <p>S- some text at the beginning of the deletion is not tart marked as deleted even though it clearly should be.</p> <p>short-</p> <p>End some text at the end of the deletion is not marked as deleted even though it clearly should be.</p> <p>par-</p> <p>tial some text in the deletion is not marked as deleted even though it clearly should be.</p> <p>un-</p> <p>re- the deletion is not faulty.[Default]</p> <p>mark-</p> <p>able</p> <p>Note Status information on each deletion is needed rather rarely except in critical editions from authorial manuscripts; status information on additions is even less common.</p> <p>Marking a deletion or addition as faulty is inescapably an interpretive act; the usual test applied in practice is the linguistic acceptability of the text with and without the letters or words in question.</p> <p>cause documents the presumed cause for the intervention.</p>

	<p>Status Optional</p> <p>Datatype teidata.enumerated</p>
seq	<p>(sequence) assigns a sequence number related to the order in which the encoded features carrying this attribute are believed to have occurred.</p> <p>Status Optional</p> <p>Datatype teidata.count</p>

6.3.56. att.translatable

att.translatable provides attributes used to indicate the status of a translatable portion of an ODD document.

Module	tei
Members	desc
Attributes	<p>Attributes</p> <p>versionDate specifies the date on which the source text was extracted and sent to the translator</p> <p>Status Optional</p> <p>Datatype teidata.temporal.w3c</p> <p>Note The <i>versionDate</i> attribute can be used to determine whether a translation might need to be revisited, by comparing the modification date on the containing file with the <i>versionDate</i> value on the translation. If the file has changed, changelogs can be checked to see whether the source text has been modified since the translation was made.</p>

6.3.57. att.typed

att.typed provides attributes which can be used to classify or subclassify elements in any way. [1.3.1. Attribute Classes 17.1.1. Words and Above 3.5.1. Referring Strings 3.6. Simple Links and Cross-References 3.5.5. Abbreviations and Their Expansions 3.12.1. Core Tags for Verse 7.2.5. Speech Contents 4.1.1. Un-numbered Divisions 4.1.2. Numbered Divisions 4.2.1. Headings and Trailers 4.4. Virtual Divisions 13.3.2.3. Personal Relationships 11.3.1.1. Core Elements for Transcriptional Work 16.1.1. Pointers and Links 16.3. Blocks, Segments, and Anchors 12.2. Linking the Apparatus to the Text 22.5.1.2. Defining Content Models: RELAX NG 8.3. Elements Unique to Spoken Texts 23.3.1.4. Modification of Attribute and Attribute Value Lists]

Module	tei
Members	att.pointing.group [linkGrp] TEI ab accMat add addName addSpan altIdentifier anchor bibl biblStruct binaryObject bloc cb change cit climate collection corr correspDesc country date decoNote del delSpan district div event explicit figure floatingText forename g gb genName geogFeat geogName head kinесic label lb lg link listBibl listEvent listNym listObject listOrg listPerson listPlace listRelation location measureGrp media milestone msDesc msName name nameLink note nym object objectName offset org orgName origDate origPlace pb pc persName place placeName population provenance ptr quote ref reg region relatedItem relation roleName rs schemaRef seal seg settlement space stamp state surface surname table teiCorpus term terrain text time trailer trait unit vocal xenoData zone
Attributes	<p>Attributes</p> <p>type characterizes the element in some sense, using any convenient classification scheme or typology.</p> <p>Status Optional</p> <p>Datatype teidata.enumerated</p> <pre><div type="verse"> <head>Night in Tarras</head> <lg type="stanza"> <l>At evening tramping on the hot white road</l> <l>...</l> </lg> <lg type="stanza"> <l>A wind sprang up from nowhere as the sky</l> <l>...</l> </lg></pre>

	</div>	
	<p>Note The <i>type</i> attribute is present on a number of elements, not all of which are members of <i>att.typed</i>, usually because these elements restrict the possible values for the attribute in a specific way.</p> <p>subtype provides a sub-categorization of the element, if needed</p> <p>Status Optional</p> <p>Datatype <i>teidata.enumerated</i></p> <p>Note The <i>subtype</i> attribute may be used to provide any sub-classification for the element additional to that provided by its <i>type</i> attribute.</p>	
Schematron	<sch:rule context="tei:*[@subtype]"> <sch:assert test="@type">The <sch:name/> element should not be categorized in detail with @subtype unless also categorized in general with @type</sch:assert> </sch:rule>	
Note	When appropriate, values from an established typology should be used. Alternatively a typology may be defined in the associated TEI header. If values are to be taken from a project-specific list, this should be defined using the <valList> element in the project-specific schema description, as described in 23.3.1.4. Modification of Attribute and Attribute Value Lists .	

6.3.58. *att.written*

att.written provides an attribute to indicate the hand in which the content of an element was written in the source being transcribed. [1.3.1. Attribute Classes]

Module	tei
Members	<u>att.transcriptional</u> [<u>add</u> <u>addSpan</u> <u>del</u> <u>delSpan</u> <u>subst</u>] <u>ab</u> <u>closer</u> <u>div</u> <u>figure</u> <u>fw</u> <u>head</u> <u>hi</u> <u>label</u> <u>note</u> <u>opener</u> <u>p</u> <u>postscript</u> <u>salute</u> <u>seg</u> <u>signed</u> <u>text</u> <u>trailer</u> <u>zone</u>
Attributes	<p>Attributes</p> <p>hand points to a <u><handNote></u> element describing the hand considered responsible for the content of the element concerned.</p> <p>Status Optional</p> <p>Datatype <i>teidata.pointer</i></p>

6.4. Macros

6.4.1. *macro.limitedContent*

macro.limitedContent (paragraph content) defines the content of prose elements that are not used for transcription of extant materials. [1.3. The TEI Class System]

Module	tei
Used by	<u>desc</u> <u>figDesc</u> <u>rendition</u>
Content model	<pre><content> <alternate minOccurs="0" maxOccurs="unbounded"> <textNode/> <classRef key="model.limitedPhrase"/> <classRef key="model.inter"/> </alternate> </content></pre>
Declaration	<pre>tei_macro.limitedContent = (text tei_model.limitedPhrase tei_model.inter)*</pre>

6.4.2. *macro paraContent*

macro paraContent (paragraph content) defines the content of paragraphs and similar elements. [1.3. The TEI Class System]

Module	tei
Used by	<u>ab</u> <u>add</u> <u>corr</u> <u>del</u> <u>emph</u> <u>hi</u> <u>orig</u> <u>p</u> <u>ref</u> <u>reg</u> <u>salute</u> <u>seg</u> <u>sic</u> <u>signed</u> <u>supplied</u> <u>title</u> <u>unclear</u>

Content model	<pre><content> <alternate minOccurs="0" maxOccurs="unbounded"> <textNode/> <classRef key="model.gLike"/> <classRef key="model.phrase"/> <classRef key="model.inter"/> <classRef key="model.global"/> <elementRef key="lg"/> <classRef key="model.lLike"/> </alternate> </content></pre>
Declaration	<pre>tei_macro.paraContent = (text tei_model.gLike tei_model.phrase tei_model.inter tei_model.global tei_lg tei_model.lLike)*</pre>

6.4.3. macro.phraseSeq

macro.phraseSeq (phrase sequence) defines a sequence of character data and phrase-level elements. [1.4.1. Standard Content Models]

Module	tei
Used by	<u>abbr</u> <u>addName</u> <u>addrLine</u> <u>affiliation</u> <u>author</u> <u>biblScope</u> <u>birth</u> <u>bloc</u> <u>catchwords</u> <u>citedRange</u> <u>country</u> <u>death</u> <u>distinct</u> <u>distributor</u> <u>district</u> <u>docDate</u> <u>edition</u> <u>editor</u> <u>education</u> <u>expan</u> <u>explicit</u> <u>extent</u> <u>faith</u> <u>floruit</u> <u>foreign</u> <u>forename</u> <u>fw</u> <u>genName</u> <u>geoDecl</u> <u>geogFeat</u> <u>geogName</u> <u>label</u> <u>material</u> <u>measure</u> <u>mentioned</u> <u>name</u> <u>nameLink</u> <u>nationality</u> <u>num</u> <u>objectName</u> <u>objectType</u> <u>offset</u> <u>orgName</u> <u>origPlace</u> <u>persName</u> <u>placeName</u> <u>pubPlace</u> <u>publisher</u> <u>region</u> <u>residence</u> <u>role</u> <u>roleDesc</u> <u>roleName</u> <u>rs</u> <u>settlement</u> <u>sex</u> <u>soCalled</u> <u>socecStatus</u> <u>speaker</u> <u>stamp</u> <u>street</u> <u>surname</u> <u>term</u> <u>textLang</u> <u>unit</u> <u>watermark</u>
Content model	<pre><content> <alternate minOccurs="0" maxOccurs="unbounded"> <textNode/> <classRef key="model.gLike"/> <classRef key="model.qLike"/> <classRef key="model.phrase"/> <classRef key="model.global"/> </alternate> </content></pre>
Declaration	<pre>tei_macro.phraseSeq = (text tei_model.gLike tei_model.qLike tei_model.phrase tei_model.global)*</pre>

6.4.4. macro.phraseSeq.limited

macro.phraseSeq.limited (limited phrase sequence) defines a sequence of character data and those phrase-level elements that are not typically used for transcribing extant documents. [1.4.1. Standard Content Models]

Module	tei
Used by	<u>age</u> <u>authority</u> <u>funder</u> <u>langKnown</u> <u>language</u> <u>principal</u> <u>resp</u> <u>sponsor</u>
Content model	<pre><content> <alternate minOccurs="0" maxOccurs="unbounded"> <textNode/> <classRef key="model.limitedPhrase"/> <classRef key="model.global"/> </alternate> </content></pre>

Declaration	<pre>tei_macro.phraseSeq.limited = (text tei_model.limitedPhrase tei_model.global)*</pre>
--------------------	---

6.4.5. *macro.specialPara*

macro.specialPara ('special' paragraph content) defines the content model of elements such as notes or list items, which either contain a series of component-level elements or else have the same structure as a paragraph, containing a series of phrase-level and inter-level elements. [1.3. The TEI Class System]

Module	tei
Used by	accMat acquisition additions cell change collation condition decoNote foliation handNote item layout licence metamark note occupation origin provenance q quote source stage summary support
Content model	<pre><content> <alternate minOccurs="0" maxOccurs="unbounded"> <textNode/> <classRef key="model.gLike"/> <classRef key="model.phrase"/> <classRef key="model.inter"/> <classRef key="model.divPart"/> <classRef key="model.global"/> </alternate> </content></pre>
Declaration	<pre>tei_macro.specialPara = (text tei_model.gLike tei_model.phrase tei_model.inter tei_model.divPart tei_model.global)*</pre>

6.4.6. *macro.xtext*

macro.xtext (extended text) defines a sequence of character data and gaiji elements.	
Module	tei
Used by	collection height institution repository width
Content model	<pre><content> <alternate minOccurs="0" maxOccurs="unbounded"> <textNode/> <classRef key="model.gLike"/> </alternate> </content></pre>
Declaration	<pre>tei_macro.xtext = (text tei_model.gLike)*</pre>

6.5. Datatypes

6.5.1. *teidata.certainty*

teidata.certainty defines the range of attribute values expressing a degree of certainty.	
Module	tei
Used by	teidata.probCert
Content model	<pre><content> <valList type="closed"> <valItem ident="high"/> <valItem ident="medium"/> <valItem ident="low"/> <valItem ident="unknown"/> </valList> </content></pre>
Declaration	<pre>tei_tedata.certainty = "high" "medium" "low" "unknown"</pre>

Note	Certainty may be expressed by one of the predefined symbolic values high, medium, or low. The value unknown should be used in cases where the encoder does not wish to assert an opinion about the matter.
-------------	--

6.5.2. teidata.count

teidata.count defines the range of attribute values used for a non-negative integer value used as a count.	
Module	tei
Used by	<p>Element:</p> <ul style="list-style-type: none"> • <code>age/@value</code> • <code>handDesc/@hands</code> • <code>layout/@columns</code> • <code>layout/@streams</code> • <code>layout/@ruledLines</code> • <code>layout/@writtenLines</code> • <code>refState/@length</code> • <code>table/@rows</code> • <code>table/@cols</code> • <code>zone/@rotate</code>
Content model	<pre><content> <dataRef name="nonNegativeInteger" /> </content></pre>
Declaration	<code>tei_teidata.count = xsd:nonNegativeInteger</code>
Note	Any positive integer value or zero is permitted

6.5.3. teidata.duration.iso

teidata.duration.iso defines the range of attribute values available for representation of a duration in time using ISO 8601 standard formats	
Module	tei
Used by	
Content model	<pre><content> <dataRef name="token" restriction="[^0-9.,DHMPRSTWYZ/:+\-]+"/> </content></pre>
Declaration	<code>tei_teidata.duration.iso = token { pattern = "[0-9.,DHMPRSTWYZ/:+\-]+" }</code>
Example	<code><time dur-iso="PT0,75H">three-quarters of an hour</time></code>
Example	<code><date dur-iso="P1,5D">a day and a half</date></code>
Example	<code><date dur-iso="P14D">a fortnight</date></code>
Example	<code><time dur-iso="PT0.02S">20 ms</time></code>
Note	<p>A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the last, which may have a decimal component (using either . or , as the decimal point; the latter is preferred). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first ‘time’ number-letter pair.</p> <p>For complete details, see ISO 8601 <i>Data elements and interchange formats — Information interchange — Representation of dates and times</i>.</p>

6.5.4. teidata.duration.w3c

teidata.duration.w3c defines the range of attribute values available for representation of a duration in time using W3C datatypes.	
Module	tei
Used by	
Content model	<pre><content> <dataRef name="duration"/> </content></pre>
Declaration	<code>tei_teidata.duration.w3c = xsd:duration</code>
Example	<code><time dur="PT45M">forty-five minutes</time></code>
Example	<code><date dur="P1DT12H">a day and a half</date></code>
Example	<code><date dur="P7D">a week</date></code>
Example	<code><time dur="PT0.02S">20 ms</time></code>
Note	<p>A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the S number, which may have a decimal component (using . as the decimal point). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first ‘time’ number-letter pair.</p> <p>For complete details, see the W3C specification.</p>

6.5.5. teidata.enumerated

teidata.enumerated defines the range of attribute values expressed as a single XML name taken from a list of documented possibilities.	
Module	tei
Used by	<p>Element:</p> <ul style="list-style-type: none"> • <code>abbr/@type</code> • <code>add/@place</code> • <code>affiliation/@type</code> • <code>age/@type</code> • <code>availability/@status</code> • <code>birth/@type</code> • <code>castItem/@type</code> • <code>correction/@status</code> • <code>correction/@method</code> • <code>correspAction/@type</code> • <code>death/@type</code> • <code>desc/@type</code> • <code>dimensions/@type</code> • <code>distinct/@type</code> • <code>divGen/@type</code> • <code>education/@type</code> • <code>faith/@type</code> • <code>fw/@type</code> • <code>gap/@reason</code> • <code>gap/@agent</code>

	<ul style="list-style-type: none"> • <u>geoDecl</u>/@datum • <u>hyphenation</u>/@eol • <u>idno</u>/@type • <u>langKnowledge</u>/@type • <u>list</u>/@type • <u>measure</u>/@type • <u>nationality</u>/@type • <u>normalization</u>/@method • <u>num</u>/@type • <u>objectDesc</u>/@form • <u>occupation</u>/@type • <u>pc</u>/@force • <u>pc</u>/@unit • <u>person</u>/@role • <u>person</u>/@age • <u>personGrp</u>/@role • <u>personGrp</u>/@age • <u>persona</u>/@role • <u>persona</u>/@age • <u>punctuation</u>/@marks • <u>punctuation</u>/@placement • <u>q</u>/@type • <u>quotation</u>/@marks • <u>relation</u>/@name • <u>rendition</u>/@scope • <u>residence</u>/@type • <u>sex</u>/@type • <u>socecStatus</u>/@type • <u>space</u>/@dim • <u>stage</u>/@type • <u>supportDesc</u>/@material • <u>surface</u>/@attachment • <u>title</u>/@type • <u>title</u>/@level • <u>unclear</u>/@reason • <u>unclear</u>/@agent
Content model	<pre><content> <dataRef key="teidata.word"/> </content></pre>
Declaration	<pre>tei_teidata.enumerated = teidata.word</pre>
Note	<p>Attributes using this datatype must contain a single ‘word’ which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.</p> <p>Typically, the list of documented possibilities will be provided (or exemplified) by a value list in the associated attribute specification, expressed with a <u><valList></u> element.</p>

6.5.6. teidata.language

teidata.language defines the range of attribute values used to identify a particular combination of human language and writing system. [6.1. Language Identification]	
Module	tei
Used by	<p>Element:</p> <ul style="list-style-type: none"> • <code>langKnowledge/@tags</code> • <code>langKnown/@tag</code> • <code>language/@ident</code> • <code>textLang/@mainLang</code> • <code>textLang/@otherLangs</code>
Content model	<pre><content> <alternate> <dataRef name="language"/> <valList> <valItem ident="" /> </valList> </alternate> </content></pre>
Declaration	<code>tei_teidata.language = xsd:language ("")</code>
Note	<p>The values for this attribute are language ‘tags’ as defined in BCP 47. Currently BCP 47 comprises RFC 5646 and RFC 4647; over time, other IETF documents may succeed these as the best current practice.</p> <p>A ‘language tag’, per BCP 47, is assembled from a sequence of components or <i>subtags</i> separated by the hyphen character (‐, U+002D). The tag is made of the following subtags, in the following order. Every subtag except the first is optional. If present, each occurs only once, except the fourth and fifth components (variant and extension), which are repeatable.</p> <p>language The IANA-registered code for the language. This is almost always the same as the ISO 639 2-letter language code if there is one. The list of available registered language subtags can be found at http://www.iana.org/assignments/language-subtag-registry. It is recommended that this code be written in lower case.</p> <p>script The ISO 15924 code for the script. These codes consist of 4 letters, and it is recommended they be written with an initial capital, the other three letters in lower case. The canonical list of codes is maintained by the Unicode Consortium, and is available at http://unicode.org/iso15924/iso15924-codes.html. The IETF recommends this code be omitted unless it is necessary to make a distinction you need.</p> <p>region Either an ISO 3166 country code or a UN M.49 region code that is registered with IANA (not all such codes are registered, e.g. UN codes for economic groupings or codes for countries for which there is already an ISO 3166 2-letter code are not registered). The former consist of 2 letters, and it is recommended they be written in upper case; the list of codes can be searched or browsed at https://www.iso.org/obp/ui/#search/code/. The latter consist of 3 digits; the list of codes can be found at http://unstats.un.org/unsd/methods/m49/m49.htm.</p> <p>variant An IANA-registered variation. These codes are used to indicate additional, well-recognized variations that define a language or its dialects that are not covered by other available subtags.</p> <p>extension An extension has the format of a single letter followed by a hyphen followed by additional subtags. These exist to allow for future extension to BCP 47, but as of this writing no such extensions are in use.</p> <p>private use An extension that uses the initial subtag of the single letter <i>x</i> (i.e., starts with <i>x-</i>) has no meaning except as negotiated among the parties involved. These should be used with great care, since they interfere with the interoperabil-</p>

ity that use of RFC 4646 is intended to promote. In order for a document that makes use of these subtags to be TEI-conformant, a corresponding `<language>` element must be present in the TEI header.

There are two exceptions to the above format. First, there are language tags in the IANA registry that do not match the above syntax, but are present because they have been ‘grandfathered’ from previous specifications.

Second, an entire language tag can consist of only a private use subtag. These tags start with `x-`, and do not need to follow any further rules established by the IETF and endorsed by these Guidelines. Like all language tags that make use of private use subtags, the language in question must be documented in a corresponding `<language>` element in the TEI header.

Examples include

<code>sn</code>	Shona
<code>zh-TW</code>	Taiwanese
<code>zh-Han-t-HK</code>	Chinese written in traditional script as used in Hong Kong
<code>en-SL</code>	English as spoken in Sierra Leone
<code>pl</code>	Polish
<code>es-MX</code>	Spanish as spoken in Mexico
<code>es-419</code>	Spanish as spoken in Latin America

The W3C Internationalization Activity has published a useful introduction to BCP 47, Language tags in HTML and XML.

6.5.7. teidata.name

teidata.name defines the range of attribute values expressed as an XML Name.	
Module	tei
Used by	Element: <ul style="list-style-type: none">• <code>index/@indexName</code>
Content model	<pre><content> <dataRef name="Name" /> </content></pre>
Declaration	<pre>tei_teidata.name = xsd:Name</pre>
Note	Attributes using this datatype must contain a single word which follows the rules defining a legal XML name (see http://www.w3.org/TR/REC-xml/#dt-name): for example they cannot include whitespace or begin with digits.

6.5.8. teidata.namespace

teidata.namespace defines the range of attribute values used to indicate XML namespaces as defined by the W3C Namespaces in XML Technical Recommendation.	
Module	tei
Used by	Element: <ul style="list-style-type: none">• <code>namespace/@name</code>
Content model	<pre><content> <dataRef name="anyURI" /> </content></pre>
Declaration	<pre>tei_teidata.namespace = xsd:anyURI</pre>
Note	The range of syntactically valid values is defined by RFC 3986 <i>Uniform Resource Identifier (URI): Generic Syntax</i>

6.5.9. teidata.numeric

teidata.numeric defines the range of attribute values used for numeric values.	
Module	tei
Used by	Element: <ul style="list-style-type: none">• <code>num/@value</code>
Content model	<pre><content> <alternate> <dataRef name="double"/> <dataRef name="token" restrictions="(\-?[\d]+/\-?[\d]+)"/> <dataRef name="decimal"/> </alternate> </content></pre>
Declaration	<pre>tei_teidata.numeric = xsd:double token { pattern = "(\-?[\d]+/\-?[\d]+) " } xsd:decimal</pre>
Note	<p>Any numeric value, represented as a decimal number, in floating point format, or as a ratio.</p> <p>To represent a floating point number, expressed in scientific notation, ‘E notation’, a variant of ‘exponential notation’, may be used. In this format, the value is expressed as two numbers separated by the letter E. The first number, the significand (sometimes called the mantissa) is given in decimal format, while the second is an integer. The value is obtained by multiplying the mantissa by 10 the number of times indicated by the integer. Thus the value represented in decimal notation as 1000.0 might be represented in scientific notation as 10E3.</p> <p>A value expressed as a ratio is represented by two integer values separated by a solidus (/) character. Thus, the value represented in decimal notation as 0.5 might be represented as a ratio by the string 1/2.</p>

6.5.10. teidata.outputMeasurement

teidata.outputMeasurement defines a range of values for use in specifying the size of an object that is intended for display.	
Module	tei
Used by	
Content model	<pre><content> <dataRef name="token" restriction="[-+]?d+(\.\d+)?(% cm mm in pt pc px em ex gd rem vw vh vm)"/> </content></pre>
Declaration	<pre>tei_teidata.outputMeasurement = token { pattern = "[\-\+]?d+(\.\d+)?(% cm mm in pt pc px em ex gd rem vw vh vm) "</pre>
Example	<pre><figure> <head>The TEI Logo</head> <figDesc>Stylized yellow angle brackets with the letters <mentioned>TEI</mentioned> in between and <mentioned>text encoding initiative</mentioned> underneath, all on a white background.</figDesc> <graphic height="600px" width="600px" url="http://www.tei-c.org/logos/TEI-600.jpg"/> </figure></pre>
Note	<p>These values map directly onto the values used by XSL-FO and CSS. For definitions of the units see those specifications; at the time of this writing the most complete list is in the CSS3 working draft.</p>

6.5.11. teidata.pattern

teidata.pattern defines attribute values which are expressed as a regular expression.	
Module	tei
Used by	
Content model	<pre><content> <dataRef name="token"/> </content></pre>

Declaration	<pre>tei_teidata.pattern = token</pre>
Note	<p>A regular expression, often called a <i>pattern</i>, is an expression that describes a set of strings. They are usually used to give a concise description of a set, without having to list all elements. For example, the set containing the three strings <i>Handel</i>, <i>Händel</i>, and <i>Haendel</i> can be described by the pattern <code>H(ä æ?)ndel</code> (or alternatively, it is said that the pattern <code>H(ä æ?)ndel</code> matches each of the three strings)</p> <p>Wikipedia This TEI datatype is mapped to the XSD token datatype, and may therefore contain any string of characters. However, it is recommended that the value used conform to the particular flavour of regular expression syntax supported by XSD Schema.</p>

6.5.12. teidata.point

teidata.point defines the data type used to express a point in cartesian space.	
Module	tei
Used by	
Content model	<pre><content> <dataRef name="token" restriction="(-?[0-9]+(\.[0-9]+)?,-?[0-9]+(\.[0-9]+)?)" /> </content></pre>
Declaration	<pre>tei_teidata.point = token { pattern = "(-?[0-9]+(\.[0-9]+)?,-?[0-9]+(\.[0-9]+)?)" }</pre>
Example	<pre><facsimile> <surface ulx="0" uly="0" lrx="400" lry="280"> <zone points="220,100 300,210 170,250 123,234"> <graphic url="handwriting.png" /> </zone> </surface> </facsimile></pre>
Note	A point is defined by two numeric values, which should be expressed as decimal numbers. Neither number can end in a decimal point. E.g., both 0,84,2 and 0,84 are allowed, but 0,84. is not.

6.5.13. teidata.pointer

teidata.pointer defines the range of attribute values used to provide a single URI, absolute or relative, pointing to some other resource, either within the current document or elsewhere.

Module	tei
Used by	<p>Element:</p> <ul style="list-style-type: none"> • catRef/@scheme • change/@target • event/@where • g/@ref • handShift/@new • keywords/@scheme • metamark/@target • note/@targetEnd • nym/@parts • occupation/@scheme • occupation/@code • relatedItem/@target • relation/@active • relation/@mutual • relation/@passive

	<ul style="list-style-type: none"> • <u>socecStatus/@scheme</u> • <u>socecStatus/@code</u> • <u>space/@resp</u>
Content model	<pre><content> <dataRef name="anyURI" /> </content></pre>
Declaration	<code>tei_teidata.pointer = xsd:anyURI</code>
Note	The range of syntactically valid values is defined by RFC 3986 <i>Uniform Resource Identifier (URI): Generic Syntax</i> . Note that the values themselves are encoded using RFC 3987 <i>Internationalized Resource Identifiers</i> (IRIs) mapping to URIs. For example, https://secure.wikimedia.org/wikipedia/en/wiki/% is encoded as https://secure.wikimedia.org/wikipedia/en/wiki/%25 while http://mr----nx.mirbg4--n###.#####-####.####/ is encoded as http://ckbbajlc6dj7bxne2c.xn--wgbh1c/

6.5.14. teidata.prefix

teidata.prefix defines a range of values that may function as a URI scheme name.	
Module	tei
Used by	<p>Element:</p> <ul style="list-style-type: none"> • <u>prefixDef/@ident</u>
Content model	<pre><content> <dataRef name="token" restriction="[a-z][a-z0-9\+\.\-\-]*" /> </content></pre>
Declaration	<code>tei_teidata.prefix = token { pattern = "[a-z][a-z0-9\+\.\-\-]*" }</code>
Note	This datatype is used to constrain a string of characters to one that can be used as a URI scheme name according to RFC 3986, section 3.1. Thus only the 26 lowercase letters a–z, the 10 digits 0–9, the plus sign, the period, and the hyphen are permitted, and the value must start with a letter.

6.5.15. teidata.probCert

teidata.probCert defines a range of attribute values which can be expressed either as a numeric probability or as a coded certainty value.	
Module	tei
Used by	
Content model	<pre><content> <alternate> <dataRef key="teidata.probability"/> <dataRef key="teidata.certainty"/> </alternate> </content></pre>
Declaration	<code>tei_teidata.probCert = teidata.probability teidata.certainty</code>

6.5.16. teidata.probability

teidata.probability defines the range of attribute values expressing a probability.	
Module	tei
Used by	<u>teidata.probCert</u>
Content model	<pre><content> <dataRef name="double"/> </content></pre>
Declaration	<code>tei_teidata.probability = xsd:double</code>

Note	Probability is expressed as a real number between 0 and 1; 0 representing <i>certainly false</i> and 1 representing <i>certainly true</i> .
-------------	---

6.5.17. teidata.replacement

teidata.replacement defines attribute values which contain a replacement template.	
Module	tei
Used by	
Content model	<pre><content> <textNode/> </content></pre>
Declaration	<code>tei_teidata.replacement = text</code>

6.5.18. teidata.sex

teidata.sex defines the range of attribute values used to identify human or animal sex.	
Module	tei
Used by	<p>Element:</p> <ul style="list-style-type: none"> • <code>person/@sex</code> • <code>personGrp/@sex</code> • <code>persona/@sex</code> • <code>sex/@value</code>
Content model	<pre><content> <dataRef key="teidata.word"/> </content></pre>
Declaration	<code>tei_teidata.sex = teidata.word</code>
Note	<p>Values for attributes using this datatype may be locally defined by a project, or may refer to an external standard, such as vCard's sex property http://microformats.org/wiki/gender-formats (in which M indicates male, F female, O other, N none or not applicable, U unknown), or the often used ISO 5218:2004 <i>Representation of Human Sexes</i> http://standards.iso.org/itf/PubliclyAvailableStandards/c036266_ISO_IEC_5218_2004(E_F).zip (in which 0 indicates unknown; 1 male; 2 female; and 9 not applicable, although the ISO standard is widely considered inadequate); cf. CETH's <i>Recommendations for Inclusive Data Collection of Trans People</i> http://transhealth.ucsf.edu/trans?page=lib-data-collection.</p>

6.5.19. teidata.temporal.iso

teidata.temporal.iso defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the international standard <i>Data elements and interchange formats – Information interchange – Representation of dates and times</i> .	
Module	tei
Used by	
Content model	<pre><content> <alternate> <dataRef name="date"/> <dataRef name="gYear"/> <dataRef name="gMonth"/> <dataRef name="gDay"/> <dataRef name="gYearMonth"/> <dataRef name="gMonthDay"/> <dataRef name="time"/> <dataRef name="dateTime"/> <dataRef name="token" restrictions="[0-9.,DHMPRSTWYZ/:+\\-]+"/> </alternate> </content></pre>
Declaration	<code>tei_teidata.temporal.iso = xsd:date xsd:gYear</code>

	<pre> xsd:gMonth xsd:gDay xsd:gYearMonth xsd:gMonthDay xsd:time xsd:dateTime token { pattern = "[0-9.,DHMPRSTWYZ:/+\\-]+" } </pre>
Note	<p>If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the <code>dateTime</code> representation should be used.</p> <p>For all representations for which ISO 8601 describes both a <i>basic</i> and an <i>extended</i> format, these Guidelines recommend use of the extended format.</p> <p>While ISO 8601 permits the use of both <code>00:00</code> and <code>24:00</code> to represent midnight, these Guidelines strongly recommend against the use of <code>24:00</code>.</p>

6.5.20. teidata.temporal.w3c

teidata.temporal.w3c defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the W3C XML Schema Part 2: Datatypes Second Edition specification.

Module	tei
Used by	<p>Element:</p> <ul style="list-style-type: none"> <code>docDate/@when</code>
Content model	<pre> <content> <alternate> <dataRef name="date"/> <dataRef name="gYear"/> <dataRef name="gMonth"/> <dataRef name="gDay"/> <dataRef name="gYearMonth"/> <dataRef name="gMonthDay"/> <dataRef name="time"/> <dataRef name="dateTime"/> </alternate> </content> </pre>
Declaration	<pre> tei_teidata.temporal.w3c = xsd:date xsd:gYear xsd:gMonth xsd:gDay xsd:gYearMonth xsd:gMonthDay xsd:time xsd:dateTime </pre>
Note	<p>If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the <code>dateTime</code> representation should be used.</p>

6.5.21. teidata.text

teidata.text defines the range of attribute values used to express some kind of identifying string as a single sequence of unicode characters possibly including whitespace.

Module	tei
Used by	<p>Element:</p> <ul style="list-style-type: none"> <code>distinct/@time</code> <code>distinct/@space</code> <code>distinct/@social</code> <code>refState/@delim</code> <code>rendition/@selector</code>
Content model	<pre> <content> <dataRef name="string"/> </content> </pre>
Declaration	<pre> tei_teidata.text = string </pre>
Note	<p>Attributes using this datatype must contain a single 'token' in which whitespace and other punctuation characters are permitted.</p>

6.5.22. teidata.truthValue

teidata.truthValue defines the range of attribute values used to express a truth value.	
Module	tei
Used by	<p>Element:</p> <ul style="list-style-type: none"> • <u>note</u>/@anchored • <u>pc</u>/@pre • <u>surface</u>/@flipping
Content model	<pre><content> <dataRef name="boolean"/> </content></pre>
Declaration	<code>tei_teidata.truthValue = xsd:boolean</code>
Note	<p>The possible values of this datatype are 1 or true, or 0 or false. This datatype applies only for cases where uncertainty is inappropriate; if the attribute concerned may have a value other than true or false, e.g. unknown, or inapplicable, it should have the extended version of this datatype: <code>data.xTruthValue</code>.</p>

6.5.23. teidata.version

teidata.version defines the range of attribute values which may be used to specify a TEI or Unicode version number.	
Module	tei
Used by	<p>Element:</p> <ul style="list-style-type: none"> • <u>TEI</u>/@version • <u>teiCorpus</u>/@version
Content model	<pre><content> <dataRef name="token" restriction="[\d]+(\.\[\d\]+\{0,2\})"/> </content></pre>
Declaration	<code>tei_teidata.version = token { pattern = "[\d]+(\.\[\d\]+\{0,2\})" }</code>
Note	<p>The value of this attribute follows the pattern specified by the Unicode consortium for its version number (http://unicode.org/versions/). A version number contains digits and fullstop characters only. The first number supplied identifies the major version number. A second and third number, for minor and sub-minor version numbers, may also be supplied.</p>

6.5.24. teidata.versionNumber

teidata.versionNumber defines the range of attribute values used for version numbers.	
Module	tei
Used by	
Content model	<pre><content> <dataRef name="token" restriction="[\d]+[a-z]*[\d]*(\.\[\d\]+[a-z]*[\d]*\{0,3\})"/> </content></pre>
Declaration	<code>tei_teidata.versionNumber = token { pattern = "[\d]+[a-z]*[\d]*(\.\[\d\]+[a-z]*[\d]*\{0,3\})" }</code>

6.5.25. teidata.word

teidata.word defines the range of attribute values expressed as a single word or token.	
Module	tei
Used by	<p><u>teidata.enumerated</u> <u>teidata.sexElement</u>:</p> <ul style="list-style-type: none"> • <u>binaryObject</u>/@encoding • <u>del</u>/@rend

	<ul style="list-style-type: none"> <u>langKnown</u>/@level <u>media</u>/@mimeType <u>metamark</u>/@function <u>org</u>/@role <u>personGrp</u>/@size <u>supplied</u>/@reason
Content model	<pre><content> <dataRef name="token" restriction="(\p{L} \p{N} \p{P} \p{S})+"/> </content></pre>
Declaration	<code>tei_teidata.word = token { pattern = "(\p{L} \p{N} \p{P} \p{S})+" }</code>
Note	Attributes using this datatype must contain a single ‘word’ which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.

6.5.26. teidata.xTruthValue

teidata.xTruthValue (extended truth value) defines the range of attribute values used to express a truth value which may be unknown.	
Module	tei
Used by	<p>Element:</p> <ul style="list-style-type: none"> <u>binding</u>/@contemporary <u>kinesic</u>/@iterated <u>seal</u>/@contemporary <u>vocal</u>/@iterated
Content model	<pre><content> <alternate> <dataRef name="boolean"/> <valList> <valItem ident="unknown"/> <valItem ident="inapplicable"/> </valList> </alternate> </content></pre>
Declaration	<code>tei_teidata.xTruthValue = xsd:boolean ("unknown" "inapplicable")</code>
Note	In cases where uncertainty is inappropriate, use the datatype <code>data.TruthValue</code> .

6.5.27. teidata.xmlName

teidata.xmlName defines attribute values which contain an XML name.	
Module	tei
Used by	<p>Element:</p> <ul style="list-style-type: none"> <u>schemaRef</u>/@key
Content model	<pre><content> <dataRef name="NCName"/> </content></pre>
Declaration	<code>tei_teidata.xmlName = xsd:NCName</code>
Note	The rules defining an XML name form a part of the XML Specification.

6.5.28. teidata.xpath

teidata.xpath defines attribute values which contain an XPath expression.	
Module	tei

Used by	
Content model	<pre><content> <textNode/> </content></pre>
Declaration	<pre>tei_teidata.xpath = text</pre>
Note	<p>Any XPath expression using the syntax defined in .</p> <p>When writing programs that evaluate XPath expressions, programmers should be mindful of the possibility of malicious code injection attacks. For further information about XPath injection attacks, see the article at OWASP.</p>
